 Engineers and technologists often operate from a worldview of "ones and zeros." The mission of this book is to interject the colorful world of creative thinking to help engineers and technologists learn to think

and work differently. Thus, "idea engineering" becomes the driving force, transforming engineers and technologists into innovators and entrepreneurs, using case studies and anecdotes from first-hand experience. The material in this book is organized to take the reader through basic concepts and techniques of creative thinking and innovation, to better solve engineering and technological challenges. It provides an overall understanding of who, what, why, when, and how "idea engineering" can transform an individual and a company to formulate and apply the best possibilities. The target audience is university-level students and practitioners, especially upper division undergraduates and graduate students in engineering

education, industrial engineering, engineering technology, science, and technology; and then engineering practitioners from an engineering, technology, or science background. It can be purchased individually as a text, professional trade or reference title, or accessed within a collection libraries and professional organizations would buy. In addition, the material in this book can supplement coursework in business, communication, management, and applied creative arts. As a core or supplemental text, it would make a great foundation for a one-credit course—or a part of any three-credit capstone design course or seminar—stressing creative thinking and innovation. It would also be a good overview for any layman interested in learning about creative thinking and innovation.

Andrew Yang, the founder of Venture for America, offers a unique solution to our

country's economic and social problems—our smart people should be building things. *Smart People Should Build Things* offers a stark picture of the current culture and a revolutionary model that will redirect a generation of ambitious young people to the critical job of innovating and building new businesses. As the Founder and CEO of Venture for America, Andrew Yang places top college graduates in start-ups for two years in emerging U.S. cities to generate job growth and train the next generation of entrepreneurs. He knows firsthand how our current view of education is broken. Many college graduates aspire to finance, consulting, law school, grad school, or medical school out of a vague desire for additional status and progress rather than from a genuine passion or fit. In *Smart People Should Build Things*, this self-described “recovering lawyer” and entrepreneur weaves together a compelling narrative of success stories (including his own), offering observations about the flow of talent in the United States and explanations of why current trends are leading to economic distress and cultural decline. He also presents recommendations for both policy makers and job seekers to make entrepreneurship more realistic and achievable.

“This book closes a gap in the PBL literature. It is a thoroughly researched, well documented and engagingly written three part harmony addressing conceptual frames, recurring themes, and broadening horizons. An essential addition to your library.” Professor Karl A. Smith, University of Minnesota “...a comprehensive guide for those new to PBL, and suitable for those new to teaching or for the more experienced looking for a new challenge.” Dr Liz Beaty, Director (Learning and Teaching), HEFCE “This book vividly articulates the key ideas of PBL and provides new PBL practitioners with key guiding posts for its implementation. It is an excellent contribution to the art of using PBL.” Associate Professor Oon-Seng Tan, Nanyang Technological University, Singapore ·What is problem-based learning? ·How can it be used in teaching? · How does problem-based learning affect staff and students? · How do we assess and evaluate it? Despite the growth in the use of problem-based learning since it was first popularised, there have been no resources to examine the foundations of the approach and offer straightforward guidance to those wishing to explore, understand, and implement it. This book describes the theoretical foundations of

problem-based learning and is a practical source for staff wanting to implement it. The book is designed as a text that not only explores the foundations of problem-based learning but also answers many of the frequently-asked questions about its use. It has also been designed to develop the reader's understanding beyond implementation, including issues such as academic development, cultural, diversity, assessment, evaluation and curricular models of problem-based learning. *Foundations of Problem-based Learning* is a vital resource for lecturers in all disciplines who want to understand problem-based learning and implement it effectively in their teaching.

First published in 1982, Education in Africa offers a comprehensive treatment of the development of education in Africa. Until now only scattered documents on educational growth in individual countries have been available; works devoted to Africa as a whole have tended towards the general and have, by and large, been written by outside observers. This book is a collection of illuminating syntheses of major trends in educational development in Africa, by renowned African educationists, and is the first attempt to supply the need for a comprehensive book on African education written from an African viewpoint. All but one of the chapters were written specially for the book by leading African educators each of whom has had a distinguished career and wide experience in education in his or her own country; they represent eleven nations in all. The volume is designed for African students, teachers and administrators and will also be welcomed by educational planners and by scholars working in the fields of comparative education and the history of education. It

will be of special interest to departments, institutions and faculties of education in all the universities and colleges of education in Africa, and to educators and students worldwide who are concerned with comparative African education.

Report Vishal Manocha

For today's students, learning to model the dynamics of complex systems is increasingly important across nearly all engineering disciplines. First published in 2001, Forbes T. Brown's *Engineering System Dynamics: A Unified Graph-Centered Approach* introduced students to a unique and highly successful approach to modeling system dynamics using bond graphs. Updated with nearly one-third new

material, this second edition expands this approach to an even broader range of topics. What's New in the Second Edition? In addition to new material, this edition was restructured to build students' competence in traditional linear mathematical methods before they have gone too far into the modeling that still plays a pivotal role. New topics include magnetic circuits and motors including simulation with magnetic hysteresis; extensive new material on the modeling, analysis, and simulation of distributed-parameter systems; kinetic energy in thermodynamic systems; and Lagrangian and Hamiltonian methods. MATLAB® figures prominently in this edition as well, with code available for download from the Internet. This code includes simulations for problems that appear in the later chapters as well as code for selected thermodynamic substances. Using a step-by-step pedagogy accompanied by abundant examples, graphs, illustrations, case studies, guided exercises, and homework problems, *Engineering System Dynamics: A Unified Graph-Centered Approach, Second Edition* is a text that students will embrace and continue to use well into their careers. While the first half of the book is ideal for junior-level undergraduates, the entire contents are suited for more advanced students.
