preparation manual from Kershner's
"The Flight Manuals Series." Updated
and edited by his son William C.
Kershner. The Advanced Pilot's Flight
Manual has long been a standard
reference for pilots transitioning to
advanced models and types and
preparing for the Commercial Pilot
knowledge and flight tests. This book
bridges the gap between theory and
practical application, covering the
fundamentals of airplane aerodynamics

and aircraft performance. Rules of thumb are used throughout as a means of presenting a clearer picture of the recommended performance parameters, and increasing understanding of the variable factors that affect aircraft operations such as altitude and temperature. Knowledge of these thumb rules will enable pilots to maximize performance when operating faster aircraft and at higher altitudes. Chapters are dedicated to: Airplane performance and stability for pilots Checking out in advanced models and types Emergencies and unusual situations Advanced navigation High-altitude Operations Preparing for the commercial knowledge and practical tests *Wingless Flight* University Press of Kentucky

This National Association of Rocketry handbook covers designing and building your first model rocket to launching and recovery techniques, and setting up a launch area for competition.

Emergency Maneuver Training Iowa State Press

A Flight Information Manual for the Cessna 152, for use when learning to fly on the C152 or during type rating training, and a great reference manual for pilots who fly the aircraft. Compiled from engineering manuals, manufacturers handbooks, and the author's personal in depth flight experience. Provides straight forward, useful explanations of the aircraft, systems and flight operations including performance planning, with photographs, diagrams and schematics. *BASIC Programming for Scientists and Engineers* Dutton Adult

In this manual covering basic aerobatics, William K. Kershner introduced maneuvers in order of difficulty, covering a variety of them in his clear, understandable, and humorous style. The Basic Aerobatic Manual is fully illustrated with the author's own drawings and contains a practical syllabus, a detailed bibliography and an index. Though the manual emphasizes airspeeds and techniques recommended for the Cessna Aerobat, the maneuvers described in the book may be performed in other airplanes certified for aerobatics. This manual explains and

illustrates 26 aerobatic maneuvers in a six-lesson supplement to introductory aerobatics instruction. Updated and revised by the author's son, William C. Kershner.

This is the first book to tell the story of one of Canada's most innovative aviation companies, Laurentian Air Services, and thus fills an important gap in Canadian aviation history. Drawing on extensive research and interviews with Laurentian's presidents, pilots and ground crew, author Danielle Metcalfe-Chenail explores the company's 60-year

history from its founding in 1936 in Ottawa with small biplanes through to the 1990s when it was operating scheduled flights with twin-engine Beech 99s and Beech King Air 200s. During those 60 years, Laurentian was at the forefront of air tourism in the Ottawa region and the Laurentian Mountains of Quebec as well as fly-in hunting and fishing in Canada's north. It also pioneered the use of the Grumman G-21 Goose and de Havilland Beaver commercially and provided vital air support to survey and development work for such massive undertakings as the Churchill Falls and James Bay hydroelectric projects. This book brings Laurentian's history to life through first-hand stories and an exciting collection of colour and black and white photographs,

the majority of which have not previously been published. This is a long-overdue book that appeals to armchair bush flyers and aviation historians alike. *The Flight Instructor's Manual* Aviation Supplies & Academics

Most lifting bodies, or "flying bathtubs" as they were called, were so ugly only an engineer could love them, and yet, what an elegant way to keep wings from burning off in supersonic flight between earth and orbit. Working in their spare time (because they couldn't initially get official permission), Dale Reed and his team of engineers demonstrated the potential of the design that led to the Space Shuttle. *Wingless Flight* takes us behind the scenes with just the right blend of technical information and fascinating detail (the crash of M2-F2

found new life as the opening credit for TV's "The Six Million Dollar Man"). The flying bathtub, itself, is finding new life as the proposed escape-pod for the Space Station.

 Emergency Maneuver Training is a textbook for emergency maneuvers and other unusual attitude training programs as well as a source book for independent study. It explains the EMT (Emergency Maneuver Training) Program developed by the author and taught to acclaim throughout the USA. The book--enhanced by 115 illustrations--helps pilots develop an integrated understanding of the direct effects of airplane controls when applied

individually and in combination; of human factors and variables introduced into the flight process by pilots; and of proper pilot procedures to remedy difficult situations encountered in flight.
