In unicellular organisms, cell division is the means of reproduction; in multicellular organisms, it is the means of tissue growth and maintenance. Survival of the eukaryotes depends upon interactions between many cell types, and it is essential that a balanced distribution of types be maintained. This is achieved by the highly regulated process of cell proliferation. Chapter 10 Cell Growth and Division Worksheet Answer Key A form of cell division happening in sexually reproducing organisms by which two consecutive nuclear divisions (meiosis I and meiosis II) occur without the chromosomal replication in between, leading to the production of four haploid gametes (sex cells), each containing one of every pair of homologous chromosomes (that is, with the maternal and paternal chromosomes being distributed randomly between the cells). Quiz Questions Over Cell Growth And Division - ProProfs Quiz The cell cycle is the regular pattern of growth, DNA duplication, and cell division that occurs in eukaryotic cells. FIGURE 5.1 shows its four main stages: gap 1, synthesis, gap 2, and mitosis. Gap 1, synthesis, and gap 2 together make up what is called interphase. The stages of the cell cycle get their names from early studies of cell division. CHAPTER 5 Cell Growth and Division The Cell Cycle The cell cycle is the series of events in the growth and division of a cell. ► In the prokaryotic cell cycle, the cell grows, duplicates its DNA, and divides by pinching in the cell membrane. ► The eukaryotic cell cycle has four stages (the first three of which are referred to as interphase): • In the G1. 1 Cell Growth, Division, and Reproduction Answer: 2.
