Penggunaan modalitas sinar-X di bidang radiologi kedokteran gigi telah berkembang pesat, salah satunya adalah pesawat sinar-X handheld portabel. Selain memiliki manfaat yang sangat besar dalam penentuan diagnosis dan rencana perawatan, sifat sinar-X juga memiliki energi besar sehingga mampu menembus jarak lebih jauh dan kemampuannya menyebabkan kerusakan biologis pada jaringan hidup, maka perlu disadari bahwa penggunaan sinar-X yang tidak sesuai dengan kaidah proteksi radiasi akan menimbulkan suatu dampak negatif. Oleh sebab diperlukan evaluasi mendalam terhadap suatu modalitas, prosedur, dan teknik baru yang menggunakan radiasi

pengion khususnya sinar-X. Banyak kekurangpahaman secara menyeluruh mengenai fungsi dan protokol keamanan penggunaan pesawat sinar-X ini terutama dalam hal penerapan prinsip proteksi radiasi, baik untuk operator maupun pasien terhadap paparan radiasi pengion. Hal ini menjadi perhatian penting karena dalam pengoperasian pesawat sinar-X handheld portabel ini, operator harus memegang atau menggenggam perangkat selama paparan media kepada pasien, operator tidak dapat mengambil jarak yang cukup dari area sumber sinar-X sehingga radiasi hambur (scattered radiation) sulit dihindari. Dibutuhkan suatu kesadaran proteksi radiasi dalam

penggunaan modalitas sinar-X ini. Perizinan penggunaan modalitas radiografi menjadi suatu hal yang wajib dipenuhi oleh pengguna. Di Indonesia sendiri segala urusan perizinan modalitas radiografi diatur dan diawasi oleh BAPETEN. Untuk penggunaan pesawat sinar-X handheld portabel diatur dalam "Peraturan BAPETEN Nomor 4 Tahun 2020 tentang Keselamatan Radiasi pada Penggunaan Pesawat Sinar-X dalam Radiologi Diagnostik dan Intervensionar BAPETEN belum merekomendasikan dan mengizinkan sama sekali penggunaan pesawat sinar-X handheld portabel untuk kebutuhan pemeriksaan rutin atau pemeriksaan pada praktik dokter gigi. Penggunaan pesawat sinar-X pada praktik pribadi, praktik bersama, klinik ataupun rumah sakit yang ideal diperlukan perizinan sesuai dengan spesifikasi dan peraturan BAPETEN yang bertujuan agar instalasi radiodiagnosis tersebut bermanfaat sebagai penunjang diagnosis, dan terdapat jaminan keamanan pesawat sinar-X bagi dokter, pasien, dan lingkungan.

In the past decades, the mainstream of microelectronics progression was mainly powered by Moore's law focusing on IC miniaturization down to nano scale. However, there is a fast increasing need for "More than Moore" (MtM) products and technology that are based upon or derived from silicon technologies, but do not simply scale with Moore's law. This book provides new vision, strategy and guidance for the future technology and business development of micro/nanoelectronics.

Nondestructive Testing Methods and New

Applications Springer Science & Business Media

Whenever radioactivity is released to the atmosphere, for example by the detonation of nuclear weapons or the testing of nuclear weapons or from nuclear reactor accidents that fraction of it which remains airborne for more than a few hours is liable to be attached to aerosol particles. The resulting radioactive aerosols are carried by atmospheric mixing processes until they settle out or are scavenged by precipitation. The radiation exposure pathway of maximum concern to humans is by inhalation of aerosols and their deposition in the respiratory tract. In this context, it is important to note that radioactive aerosols are commonly of natural origin also. In particular, the associated radionuclides can be of natural terrestrial origin, such as the decay products of radon gas, or they can be cosmogenic, such as beryllium-7. The exposure of miners of uranium and other ores and minerals to radon and its aerosol-borne decay products is of major significance. The book describes the formation of aerosols, their aerodynamic size distribution, their atmospheric residence time, their sampling and measurement, the range of radioactive aerosols found and studied thus far, including man-made nuclides and radon decay products and their interaction with man, including deposition in the lung and subsequent health effects. - Advanced level science handbook for researchers, scientists and academics - Covers all aspects of radiation exposure in humans, including subsequent health implications - Presents the latest findings and analysis in this highly topical area

Nondestructive testing enables scientists and engineers to evaluate the integrity of their structures and the properties of their materials or components non-invasively, and in some instances in real-time fashion. Applying the Nondestructive techniques and modalities offers valuable savings and guarantees the quality of engineered systems and products. This technology can be employed through different modalities that include contact methods such as ultrasonic, eddy current, magnetic particles, and liquid penetrant, in addition to contact-less methods such as in thermography, radiography, and shearography. This book seeks to introduce some of the Nondestructive testing methods from its theoretical fundamentals to its specific applications. Additionally, the text contains several novel implementations of such techniques

in different fields, including the assessment of civil structures (concrete) to its application in medicine.
