This is the eBook version of the printed book. This Element is an excerpt from The ETF Trend Following Playbook: Profiting from Trends in Bull or Bear Markets with Exchange Traded Funds (ISBN: 9780137029013) by Tom Lydon. Available in print and digital formats. Why you need to seriously consider investments in gold and oil, right now! In the late 1990s, when people jumped into technology stocks, one of the most valued and safest investments—gold—got no respect. By 1999, central banks were dumping gold as fast as they could, heeding a noteworthy economist who called it a “barbaric relic.”

That depression didn't last long, though. Gold's price has been rising strongly since 2001.

A storm is coming, a turbulent new era in which oil prices will soar and inflation will sky-rocket. In this important new book, two leading financial strategists show you how to ride out the tempest while still capturing impressive investment returns... It's the oil, stupid. For the last thirty years, the price of oil has been the single most important determinant of the world economy. But now most geologists concur

that the planet's supply of cheaply extractable oil, the traditional fuel that powers growth, will shortly be overtaken by demand. In the coming global turbulence, oil prices will top \$100 a barrel, helping push inflation well into double digits and even posing a risk of intermittent deflation. The result will be an economy more rocky and a stock market more volatile than ever before. Fortunately, experts Stephen Leeb and Donna Leeb provide a road map that will guide you through the worst of it-and point the way to financial success. With the help of their "all season" Oil Indicator, they'll show you how to choose the right investments for any market environment, guiding you toward portfolios that prize real assets. Among the crucial lessons you'll learn: Why oil and natural gas stocks should be core holdings in every investor's portfolio Why a cautious buy-and-hold strategy is a sure money loser and why conventional "safe" stocks are really the riskiest Why gold may be on the verge of a historic bull run How the global oil wars make defense stocks a premium buy Where to find the surest bets in the burgeoning field of alternative energy How to profit from real estate without actually owning any. With its hands-on advice and savvy stock recommendations, which offer an alternative to staying in pre-inflation-era positions and risking portfolio meltdown, *The Oil Factor* promises to be the indispensable financial advice guide of the decade.

Oil to Cash explores one option to help countries with new oil revenue avoid the so-called resource curse: just give the money directly to citizens. A universal, transparent, and regular cash transfer would not only provide a concrete benefit to regular people, but would also create powerful incentives for citizens to hold their government accountable. Oil to Cash details how and where this idea could work and how policymakers can learn from the experiences with cash transfers in places like Mexico, Mongolia, and Alaska.

National Oil Companies (NOCs) directly or

indirectly control the majority of oil and gas reserves. As such, they are of great consequence to their country's economy, to importing countries' energy security, and to the stability of oil and gas markets. The paper analyzes the available evidence on the objectives, governance and performance of 20 NOCs from both net importing and net exporting countries, and draws conclusions about the design of policies and measures that are more likely to lead to social value creation. NOCs differ from private companies on a number of very important variables, including the level of competition in the market in which they operate, their business profile along the sector value chain, and their degree of commercial orientation and internationalization. Most share some core characteristics: they are usually tied to the 'national purpose' and serve political and economic goals other than maximizing the firm's profits. This paper introduces a conceptual model to analyze value creation by NOCs that takes into consideration their complex objective function. Our analysis aims to answer the following questions: Are certain corporate governance arrangements more suited than others to promote value creation? Is good geology a pre-condition for NOC value creation? Are there benefits from exposing the NOC to competition from private oil companies? Does the development of forward and backward linkages hamper NOC value creation?
