Mine Ventilation and Air Conditioning, 3rd Edition | Wiley The historic role of ventilation was to provide a flow of fresh air sufficient to replace the oxygen consumed by the miners working underground. Contemporary mine ventilation primarily deals with noxious gases (mainly generated by trackless equipment underground). mining engineering: Ventilation and Air Conditioning MINE VENTILATION SYSTEMS Ventilation is the control of air movement, its amount, and direction. Although it contributes nothing directly to the production phase of an operation, the lack of proper ventilation often will cause lower worker efficiency and decreased productivity, increased accident rates, and absenteeism. MINE VENTILATION SYSTEMS Air travels from the surface through the mine to this low pressure point. Airflow in a mine is induced by pressure differences between intake and exhaust openings. The pressure difference is caused by imposing some form of pressure at one point or a series of points in the ventilating system.
