Cognitive-Behavioral Procedures American Psychiatric Pub Violence is an epidemic that negatively impacts children across their lifespan. Reports indicate 2.1 million youth have experienced physical abuse during their lifetimes, disrupting the healthy development of children from the toddler years through adolescence, and most cases involve parents. Some parents lack the skills to effectively parent and use physical discipline as a strategy to control their children's problem behaviors. They may use increasing force if children continue to be noncompliant,

which places many children at-risk for harm. Combined Parent-Child Cognitive Behavioral Therapy (CPC-CBT), created by Melissa K. Runyon and Esther Deblinger and outlined in this guide, provides an evidence-based intervention aimed at empowering families to develop optimistic outlooks on parenting and peaceful home environments, and to decrease stress experienced both by parents and children. CPC-CBT incorporates elements from empirically supported CBT models for families who have experienced physical abuse, sexual abuse, and domestic violence; additionally, CPC-CBT draws on concepts from developmental theory, learning theory, family systems theory, and motivational interviewing. The target population includes children (ages 3-17 years) and their parents/caregivers who have already engaged in or are at-risk for physically abusive behavior towards their children. This manual is for clinicians, clinical supervisors, administrators, and others who are considering the implementation of CPC-CBT in their agencies with families at-risk for child physical abuse.

Cognitive Behaviour Therapy with Children and Young People Oxford University Press

Cognitive-Behavioral Play Therapy (CBPT) incorporates cognitive and behavioral interventions within a play therapy paradigm. It provides a theoretical framework based on cognitive-behavioral principles and integrates these in a developmentally sensitive way. Thus, play as well as verbal and nonverbal approaches are used in resolving problems. CBPT differs from nondirective play therapy, which avoids any direct discussion of the child's difficulties. A specific problem-solving approach is utilized, which helps the child develop more adaptive thoughts and behaviors. Cognitive-behavioral therapies are based on the premise that cognitions determine how people feel and act, and that faulty cognitions can contribute to psychological disturbance. Cognitive-behavioral therapies focus on identifying maladaptive thoughts, understanding the assumptions behind the thoughts, and learning to correct or counter the irrational ideas that interfere with healthy functioning. Since their development approximately twenty-five years ago, such therapies have traditionally been used with adults and only more recently with adolescents and children. It has commonly been thought that preschool-age and school-age children are too young to understand or correct distortions in their thinking. However, the recent development of CBPT reveals that cognitive strategies can be used effectively with young children if treatments are adapted in order to be developmentally sensitive and attuned to the child's needs. For

example, while the methods of cognitive therapy can be communicated to adults directly, these may need to be conveyed to children indirectly, through play activities. In particular, puppets and stuffed animals can be very helpful in modeling the use of cognitive strategies such as countering irrational beliefs and making positive self-statements. CBPT is structured and goal oriented and intervention is directive in nature.
