The Teacher's Word Book of 30,000 Words Routledge
 This report presents the results of the project Safe Future Inland Transport Systems (SafeFITS), which aims to develop a robust road safety decision-making tool to support the most appropriate road safety policies and measures to achieve tangible results. Road accidents constitute a major social problem in modern societies, accounting for more than 1 million accidents per year in EU-28 (2,900 per day), resulting in 1.4 million injuries and 26,000 fatalities (70 per day) (WHO, 2015). Road traffic injuries are estimated to be the eighth leading cause of death globally, and more than half of the people killed in traffic accidents are young adults aged between 15 and 44 years. In low-income and middle-income countries, the rates of road traffic injuries are twice those in high-income countries and still increasing. This can be partly attributed to rapid motorization in many developing countries, without any investment being made in road safety. Current trends suggest that, unless action is taken, traffic injuries will become the fifth leading cause of death by 2030, with the disparity between high-income and low-income countries further increased.

Selective Activation of Drugs by Redox Processes Springer
 This book evolved through the efforts of several organizations and the dedication of many individuals. In 1987, we received a request to propose a workshop topic for the Fifth International Theriological Congress (ITC) to be held in August 1989 in Rome, Italy. After looking up the meaning of the word "theriological" in the dictionary and discovering that it pertains to mammalian behavior, we decided a symposium on sensory abilities of whales and dolphins would be an interesting topic. The ITC convenes only every five years and has the distinction of being very well attended by scientists from around the world. We thought that hosting a workshop in conjunction with the ITC would attract a variety of international scientists that rarely have the opportunity to interact. Fortunately for all involved, our prediction was correct. The first two days of the workshop, 23-24 August 1989, were held in conjunction with ITC and the nearly 1,000 attending scientists were able to view our posters and listen to lectures. The third day was limited to only about 65 invited scientists who were divided into topical working groups chaired by a rapporteur.

"With the increased resolution power of many geophysical methods, we are seeing direct evidence of seeps on a wide variety of data, including conventional seismic. New methods and technology have also evolved to better measure and detect seeps and their artifacts and reservoir charge and to map migration and remigration routes. In addition, detection of seepage is important for minimizing the risks associated with shallow gas drilling hazards, ensuring platform stability, and preventing well blow-outs. This volume is organized into three sections, each with a different focus. The first section, "Descriptions and Observations of Seeps", includes field studies, observations of seep environments, migration systems, and use of modern sampling techniques. The second section, "Science of Seepage -- Methodology", discusses new techniques including DNA sampling, use of biomarkers, Neural Network analysis, and remote multispectral analysis. The final section, "Implications of Seeps", shows how seeps may be used to reduce prospect risk and assess risk elements such as trap seal and fault leakage. This volume is intended to be a reference for understanding seep occurrences and demonstrating the development and use of new technologies to image them with a focus on exploration and field development applications. It will be a valuable reference to geologists, geophysicists, and petroleum engineers everywhere"-- Provided by publisher.

Member States in the UNECE/WHO European Region established the Transport, Health and Environment Pan European Programme (THE PEP) in 2002. It is an intersectoral and intergovernmental policy framework and it aims to promote mobility and transport strategies that integrate environmental and health concerns. THE PEP has developed, over the years, implementation mechanisms to support the work of member States. One of those mechanisms comprises THE PEP Partnerships. THE PEP Partnerships provide a means by which member States and other stakeholders can work together in greater depth on specific issues and develop tools, methods and other resources to support policy implementation. This publication takes stock of the work done by the Partnerships, and the results achieved, and provides a clear basis for discussions on their future during the Fifth Meeting of the High-level Meeting on Transport, Health and Environment (Vienna, 22-24 October 2019).

Present knowledge of the mechanisms underlying any single sensory modality is so massive as to discourage effort directed towards completeness. The idea underlying the structure of this volume on "Sensory transduction" was to select just a few topics of general interest, which are currently being investigated and for which a reasonably clear picture is now available. During the last five years there has been a revolution in the way sensory physiologists think about transduction, and a series of exciting advances have been made in understanding the basic processes of photo transduction, chemotransduction and mechanotransduction. It is clear that in many cases the fundamental processes by which nature attains optimization of performance are similar, and that they have much in common with more general processes of signal recognition by living structures. The molecular events underlying the detection of photons by visual cells, the recognition of a given molecule by a chemoreceptor, or the level of a hormone in the extracellular fluid by a target cell,

are all very similar, and involve the activation of a sequence of events leading to a second messenger. The 20 papers that form the present volume cover various topics in the field of sensory transduction. They originate from the lectures, seminars and discussions which made up the XVIII Course of the International School of Biophysics held in Erice, 9th - 19th June 1988.

Fragment-based drug discovery is a rapidly evolving area of research, which has recently seen new applications in areas such as epigenetics, GPCRs and the identification of novel allosteric binding pockets. The first fragment-derived drug was recently approved for the treatment of melanoma. It is hoped that this approval is just the beginning of the many drugs yet to be discovered using this fascinating technique. This book is written from a Chemist's perspective and comprehensively assesses the impact of fragment-based drug discovery on a wide variety of areas of medicinal chemistry. It will prove to be an invaluable resource for medicinal chemists working in academia and industry, as well as anyone interested in novel drug discovery techniques.
