Data Structures - Algorithms Basics Algorithm is a step-by-step procedure, which defines a set of instructions to be executed in a certain order to get the desired output. Algorithms are generally created independent of underlying languages, i.e. an algorithm can be implemented in more than one programming language. Data Structures - Algorithms Basics - Tutorialspoint This is a highly technical text on the topic of data structures and algorithmic design. Data structures as used within the text are the encapsulation of data variables into a data object: coming from a C background, think of them as a "struct". Unlike C though, C++ encapsulates the methods or functions that are used to manipulate the data variables as well. Simply put, an algorithm is the recipe for manipulating the data in an object.
