Companies and institutions depend more
than ever on the availability of their
Information Technology, and most
mission critical business processes are
IT-based. Business Continuity is the
ability to do business under any
circumstances and is an essential
requirement faced by modern
companies. Both concepts - High
Availability and Disaster Recovery - are

realized by redundant systems. This book presents requirements, concepts, and realizations of redundant systems on all abstraction levels, and all given examples refer to UNIX and Linux Systems.

The effects of a technology disaster on an organization can include a prolonged disruption, loss of reputation, monetary damages, and the inability to remain in

business. Although much is known about disaster recovery and business continuance, not much research has been produced on how businesses can leverage other technology frameworks to assist information technology disaster recovery. The problem was the lack of organizational knowledge to recover from computer crime interruptions given the maturity level of existing disaster recovery programs. The purpose of this Delphi study was to understand how disaster recovery controls and processes can be modified to improve response to a computer crime caused business interruption. The overarching research question in this study was to understand what factors emerge relative to the ability of disaster recovery programs to respond to disasters caused by

computer crimes. The conceptual framework included a maturity model to look at how programs might be improved to respond to the computer crimes threat. Research data were collected from a 3 round Delphi study of 22 disaster recovery experts in the fields of disaster recovery and information security. Results from the Delphi encompass a consensus by the panel. Key findings included the need for planning for cyber security, aligning disaster recovery with cyber security, providing cyber security training for managers and staff, and applying lessons learned from experience. Implications for positive social change include the ability for organizations to return to an acceptable level of operation and continue their service

benefiting employees, customers, and other stakeholders.

Every year, nearly one in five businesses suffers a major disruption to its data or voice networks or communications systems. Since 9/11 it has become increasingly important for companies to implement a plan for disaster recovery. This comprehensive book addresses the operational and day-to-day security management requirements of business stability and disaster recovery planning specifically tailored for the needs and requirements of an Information Security Officer. This book has been written by battle tested security consultants who have based all the material, processes and problem-solving on real-world planning and recovery events in enterprise environments world wide. John has over 25 years experience in the IT and security sector. He is an often

sought management consultant for large enterprise and is currently a member of the Federal Communication Commission's Homeland Security Network Reliability and Interoperability Council Focus Group on Cybersecurity, working in the Voice over Internet Protocol workgroup. James has over 30 years experience in security operations and technology assessment as a corporate security executive and positions within the intelligence, DoD, and federal law enforcement communities. He has a Ph.D. in information systems specializing in information security and is a member of Upsilon Pi Epsilon (UPE), the International Honor Society for the Computing and Information Disciplines.
