The Engineers' Digest

This procurement specification covers tubular-shaped, coiled spring pins made of a corrosion resistant nickel base alloy of the type identified under the Unified Numbering System as UNS N07718. AS4983 has been reaffirmed to comply with the SAE five-year review policy.

Tool and Manufacturing Engineers Handbook: Quality Control and Assembly

Describes several bridging concepts, which were developed and successfully applied during the author's forty years of close involvement with UK and international bridge design, construction, maintenance and research. The concepts mainly apply to the small/medium span range of bridges and viaducts.

Bridge Modification

Quality Control and Assembly helps you meet today's competitive pressures for measuring quality, making continuous quality improvements, streamlining assembly, and making the transition to automated assembly systems and applications.

Portable Design

Table 3, Practical Length Increments and Ranges, indicates spring pin sizes. Information on availability of individual lengths in the various types, weights, and materials may be obtained from suppliers. The tolerance on length for coiled type spring pins shall be plus or minus 0.010 in. for sizes up to and including 5/16 in.; and plus or minus 0.015 in. for sizes larger than 5/16 in. The Straight-Type Straight Pins specified by SAE J496 are covered by the current American National Standard, ASME B18.82 which provides more complete specifications for these types of pins and is maintained continuously by ASME B18 Subcommittee 8. Since this SAE Standard has not been updated in the last 30 years, it has become outdated. It is counterproductive to have differing or conflicting American standards for the same products.

Electrical Manufacturing

A file of manufacturers' catalogs compiled for the use of engineers and executives engaged in product development and design.
