Excel 2010 Advanced Pearson Education In Compensation and Benefit Design, Bashker D. Biswas shows exactly how to bring financial rigor to crucial "people" decisions associated with compensation and benefit program development. This comprehensive book begins by introducing a valuable Human Resource Life Cycle Model for considering compensation and benefit programs. Biswas thoroughly addresses the acquisition component of compensation, as well as issues related to general compensation, equity compensation, and pension accounting. He assesses the full financial impact of executive compensation programs and employee benefit plans, and discusses the unique issues associated with international HR systems and programs. This book contains a full chapter on HR key indicator reporting, and concludes with detailed coverage of trends in human resource accounting, and the deepening linkages between financial and HR planning. Replete with both full and "mini" case examples throughout, this book will be valuable to a wide spectrum of HR and financial professionals, with titles including compensation and benefits analysts, managers, directors, and consultants; HR specialists, accounting specialists, financial analysts, total rewards directors, controller, finance director, benefits actuaries, executive compensation consultants, corporate regulators, and labor attorneys. It also contains chapter-ending exercises and problems for use by students in HR and finance programs.

Excel Data Analysis Chandresh Agrawal The exercises in this unique book allow students to use spreadsheet programs such as Microsoft Excel to create working population models. The book contains basic spreadsheet exercises that explicate the concepts of statistical distributions, hypothesis testing and power, sampling techniques, and Leslie matrices. It contains exercises for modeling such crucial factors as population growth, life histories, reproductive success, demographic stochasticity, Hardy-Weinberg equilibrium, metapopulation dynamics, predator-prey interactions (Lotka-Volterra models), and many others. Building models using these exercises gives students "hands-on" information about what parameters are important in each model, how different parameters relate to each other, and how changing the parameters affects outcomes. The

"mystery" of the mathematics dissolves as the spreadsheets produce tangible graphic results. Each exercise grew from hands-on use in the authors' classrooms. Each begins with a list of objectives, background information that includes standard mathematical formulae, and annotated step-by-step instructions for using this information to create a working model. Students then examine how changing the parameters affects model outcomes and, through a set of guided questions, are challenged to develop their models further. In the process, they become proficient with many of the functions available on spreadsheet programs and learn to write and use complex but useful macros. Spreadsheet Exercises in Ecology and Evolution can be used independently as the basis of a course in quantitative ecology and its applications or as an invaluable supplement to undergraduate textbooks in ecology, population biology, evolution, and population genetics.
