The book is a collection of experiments using a single advanced 8-bit microcontroller from Microchip(R) - the PIC18F2431. The language used is XC8, free from Microchip(R), and there is no theoretical burden. The programming environment used is MPLAB X, also free from Microchip(R). The book is intended for use in companion with a theoretical reading/course on embedded systems (or similar course), along with the PIC18F2431 datasheet (Microchip document DS39616D), and all other datasheets that are included in each experiment, which should be used as reference guides. With the datasheet of any other processor different from the PIC18F2431 the book can also be used with that PIC microcontroller. All one needs to do is to look for the similar pinouts and ports in the

datasheet of the other microcontroller and follow the examples in this book. So, the knowledge gained here can be applied to other PIC microcontrollers with a little more effort. This book is a sequel to my first experiments lab book, PIC EXPERIMENTS LAB BOOK USING PIC16F877A and XC8. The previous book contained 29 Experiments; this book contains 56 Experiments. I observed that a required LCD header file "CHARACTER_MAP.h" was omitted by error in the previous book. This book includes not only the "CHARACTER_MAP.h" but also a complete LCD library header file "SUNPLUSLCD.h" which uses the "CHARACTER_MAP.h". Moreover, a new USART library file "UART.h" has been included. All the experiments implementing USART with RS232 have been replicated using Bluetooth and even more experiments on Bluetooth are added. This is because it is more convenient and economical to implement serial communication using Bluetooth than RS232 (as long as the environment is not too noisy). Other new experiments are: FTDI232, SPI, SONAR, temperature sensor, temperature controlled fan, relay, signal processing using drone radio transmitter and receiver, multichannel ADC, brushless DC motor (BLDC) ESC, bipolar stepper full-step (1 phase and 2 phase), bipolar half-step, and a light seeking robot. In addition, all codes are printed with the full MPLAB X colour for readability and understanding. The diagrams have been redrawn and posted as high quality svg images in full colour. Two new chapters, "Power supply" and "Equipment and tools" have been included. A section on troubleshooting has also been included after every similar experiment. Future editions will include more experiments and projects.

The Art of Assembly Language Programming using PIC® Technology thoroughly covers assembly language as used in programming the PIC® Microcontroller (MCU). Using the minimal instruction set, characteristic of most PIC® products, the author elaborates on the nuances of how to execute loops. Fundamental design practices are presented based on Orr's Structured Systems Development using four logical control structures. These control structures are presented in Flowcharting, Warnier-Orr® diagrams, State Diagrams, Pseudocode, and an extended example using SysML®. Basic math instructions of Add and Subtract are presented, along with a cursory presentation of advanced math routines provided as proven Microchip® utility Application Notes. Appendices are provided for completeness, especially for the advanced reader, including several Instruction Sets, ASCII character sets, Decimal-Binary-Hexadecimal conversion tables, and elaboration of ten 'Best Practices.' Two datasheets (one complete datasheet on the 10F20x series and one partial datasheet on the 16F88x series) are also provided in the Appendices to serve as an important reference, enabling the new embedded programmer to develop familiarity with the format of datasheets and the skills needed to assess the product datasheet for proper selection of a microcontroller family for any specific project. The Art of Assembly Language Programming Using PIC® Technology is written for an audience with a broad variety of skill levels, ranging from the absolute beginner completely new to embedded control to the embedded C programmer new to assembly language. With this book, you will be guided through the following areas: - Symbols and terminology used by programmers and engineers in microcontroller applications - Programming using assembly language through examples - Familiarity with design and development practices - Basics of mathematical knowledge in hexadecimal - Resources for advanced mathematical functions Approaches to locate resources - Teaches how to start writing simple code, e.g., PICmicro® 10FXXX and 12FXXX - Offers unique and novel approaches on how to add your personal touch using PICmicro® 'bread and butter' enhanced mid-range 16FXXX and 18FXXX processors - Teaches new coding and math knowledge to help build skillsets - Shows how to dramatically reduce product cost by achieving 100% control - Demonstrates how to gain optimization over C programming, reduce code space, tighten up timing loops, reduce the size of microcontrollers required, and lower overall product cost
