File Type PDF Active Faulting During Positive And Negative Inversion been described for many tectonic Active Faulting During Positive and Negative Inversion ... An active fault is a fault that is likely to become the source of another earthquake sometime in the future. Geologists

commonly consider faults to be active if there has been movement observed or evidence of seismic activity during the last 10,000 years. Active faulting is considered to be a geologic hazard - one related to earthquakes as a cause. Effects of movement on an active fault include strong ground motion, surface faulting, tectonic deformation, landslides and rockfalls, liquefaction, Active fault - Wikipedia

An active fault is one that cumulated some displacement in the recent past (see diagrams below) so

that we can speculate it is very likely that the fault will be offset again in the near future. There is not a fixed rule about what geological time scale should be used to address the activity of a fault.

Understanding Active Faulting

The GEM Active Faults team, Regional Integrated Multi-Hazard Early Warning System (RIMES), and Asian Institute of Technology (AIT) organised a 3-day regional workshop for fault experts in South-East/Asia and the Pacific, which was led by Teraphan Ornthammarath from RIMES, Pilar Villamor from GNS Science and Nick Horspool from Geoscience Australia.

The GEM Global Active Faults Database (GAF-DB) is the first public, comprehensive database of active faults with worldwide coverage. The GAF-DB is a compilation of many regional datasets. The GAF-DB contains ~13,500 faults, each with associated attributes that describe the geometry, kinematics, slip rate, references, and other characteristics, as the information is available.
