revolutionize particle accelerators now in conventional accelerators particles draw energy from a radiofrequency field inside metal structures since these structures can only support a limited energy gain per induction accelerators particle acceleration and detection

The linear induction accelerator was invented by Christofilos in the 1960s. Linear induction accelerators are capable of accelerating very high beam currents (>1000 A) in a single short pulse. They have been used to generate X-rays for flash radiography (e.g. DARHT at LANL), and have been considered as particle injectors for magnetic confinement fusion and as drivers for free electron lasers.

Linear induction accelerator - Wikipedia A particle accelerator is a machine that uses electromagnetic fields to propel charged particles to very high speeds and energies, and to contain them in well-defined beams.

Large accelerators are used for basic research in particle physics. The largest accelerator currently operating is the Large Hadron Collider (LHC) near Geneva, Switzerland, operated by the CERN.

Particle accelerator - Wikipedia Circular accelerator: The accelerating particles are made to take a circular path or roughly circular path using a magnetic field. Examples for Electrodynamics or electromagnetic particle accelerator are Magnetic induction accelerator; Betatron; Linear Induction Accelerator; Linear accelerator; Circular or cyclic RF accelerators; Cyclotrons
