Difference between xylem and phloem#class:9th AS level. G.14 Distribution of vascular tissues in dicotyledonous plants Ms Cooper **Intro to transpiration (2016)** Plant Transport (OCR A Level Biology 3.3)Xylem Structure And Introductory ArticleXylem - Wikipedia Introduction This article describes xylem structure primarily in relation to its function in

long distance water transport. Our goal is to provide a brief update of the major findings in the field of xylem structure and function since M. Zimmermann published his excellent book in 1983 (Zimmermann 1983). InXylem Structure And Introductory Article FunctionXylem formation begins when the actively dividing cells of growing root and shoot tips (apical meristems) give rise to primary xylem. In woody plants, secondary xylem constitutes the major part of a mature stem or root and is formed as the plant expands in girth and builds a ring of new xylem around the original primary xylem tissues. When this happens, the primary xylem cells die and lose their conducting function, forming a hard skeleton that serves only to support the plant.xylem | Definition,

Location, Function, & Facts | Britannica  
The structure of xylem and phloem is also different. While xylem is made up of tracheids and vessels, phloem is made up of sieve tubes which have many holes for transporting nutrients. Xylem is star-shaped, while phloem is round and actually surrounds the xylem.  
Xylem - Definition, Types and Function | Biology Dictionary  
These observations have important implications for xylem development and bacterial migration through xylem.  
Vascular structure of the leaf. The diameter of xylem conduits decreased towards the margin in leaves of grape, similar to sunflower (Wang, 1985; Canny, 1993). At about 50–60 % of the leaf length, movement of paint particles and low-pressure air halted, indicating that

the open conduits ended before the leaf margins.

25.4B: Vascular Tissue: Xylem and Phloem - Biology LibreTexts • Background and Aims

The xylem, or water transport system, in vascular plants adopts different morphologies that appear sequentially during growth phases. This paper proposes an explanation of these morphologies based on engineering design principles.
