Annals of Clinical Medicine WHO Guidelines on Drawing Blood Phlebotomy uses large, hollow needles to remove blood specimens for lab testing or blood donation. Each step in the process carries risks - both for patients and health workers. Patients may be bruised. Health workers may receive needle-stick injuries. Both can become infected with bloodborne organisms such as hepatitis B, HIV, syphilis or malaria. Moreover, each step affects the quality of the specimen and the diagnosis. A contaminated specimen will produce a misdiagnosis. Clerical errors can prove fatal. The new WHO guidelines provide recommended steps for safe phlebotomy and reiterate accepted principles for drawing, collecting blood and transporting blood to laboratories/blood banks. Almost 1,000 total pages; see index at beginning of publications for a complete list of included CPGs. Each CPG includes a section on the following: 1. GOAL 2. BACKGROUND 3. EVALUATION 4. TREATMENT 5. PERFORMANCE IMPROVEMENT (PI) MONITORING 6. SYSTEM REPORTING & FREQUENCY 7. RESPONSIBILITIES & 8. REFERENCES. OVERVIEW Clinical Practice Guidelines (CPGs) are the backbone of the system-wide JTS Performance Improvement program. Health data abstracted from patient records and after action reports is analyzed and distilled into globally relevant CPGs to remove medical practice variations and prevent needless deaths. The CPGs compiled from DoDTR data and used by healthcare providers worldwide are largely responsible for the decreased Case Fatality Rate for the wars in Iraq and Afghanistan. Examples are better transfusion practices; reduced burn morbidity and mortality; near elimination of extremity compartment syndrome; better patient care documentation; and improved communication across the spectrum of care between geographically dispersed facilities. CPGs are evidence-based and developed with experts in the military and civilian communities, deployed clinicians, Service trauma/surgical consultants, JTS leadership and formerly deployed Trauma Directors and Coordinators. JTS has a formalized process for developing, reviewing, updating, and approving CPGs. The guidelines are developed and implemented by clinical subject matter experts in response to needs identified in the military area of responsibility. CPGs were developed originally for U.S. Central Command. However, collaborative efforts are ongoing with the other Combatant Commands to customize CPGs to their COCOMs. INTRODUCTION TO THE JOINT TRAUMA SYSTEM (JTS) The Joint Trauma System (JTS) is the Department of Defense (DoD) authority for the military's trauma care system. The vision of the Joint Trauma System is that every Soldier, Sailor, Marine and Airman injured on the battlefield will have the optimum chance for survival and maximum potential for functional recovery. To achieve this vision, in 2006, the JTS implemented programs for data-driven trauma system development and improvement in addition to the collection of trauma data. As part of its data collection efforts, the JTS maintains a registry of trauma patients who received care at medical treatment facilities (MTFs). Since 2007, this registry – known as the DoD Trauma Registry (DoDTR) – has documented demographic, injury, treatment, and outcomes data for all trauma patients admitted to any DoD MTF, regardless of whether the injury occurred during ongoing military operations, and is the largest military trauma data source in the world. Development of the DoDTR began during the early years of the Global War on Terror (GWOt) when the need to systematically improve trauma care for combat wounded resulted in the impromptu creation of a demonstration registry, known then as the Combat Trauma Registry (CTR). The CTR was constructed by the Center for AMEDD Strategic Studies (CASS); trauma-related information was initially abstracted into it from paper medical records received from trauma nurse coordinators (TNCs) at Landstuhl Regional Medical Center (LRMC) in Germany. Shortly after the demonstration program started, the Army Surgeon General approved its transition to an operational mode, leading to the formation of the Joint Theater Trauma System (JTTS) and, eventually, the Joint Trauma System (JTS).

WHO Guidelines on Drawing Blood

[PISA Take the Test Sample Questions from OECD's PISA Assessments](#) John Wiley & Sons

The first edition of this publication was aimed at defining the current concepts of trauma induced

coagulopathy by critically analyzing the most up-to-date studies from a clinical and basic science perspective. It served as a reference source for any clinician interested in reviewing the pathophysiology, diagnosis, and management of the coagulopathic trauma patient, and the data that supports it. By meticulously describing the methodology of most traditional as well as state of the art coagulation assays the reader is provided with a full understanding of the tests that are used to study trauma induced coagulopathy. With the growing interest in understanding and managing coagulation in trauma, this second edition has been expanded to 46 chapters from its original 35 to incorporate the massive global efforts in understanding, diagnosing, and treating trauma induced coagulopathy. The evolving use of blood products as well as recently introduced hemostatic medications is reviewed in detail. The text provides therapeutic strategies to treat specific coagulation abnormalities following severe injury, which goes beyond the first edition that largely was based on describing the mechanisms causing coagulation abnormalities. Trauma Induced Coagulopathy 2nd Edition is a valuable reference to clinicians that are faced with specific clinical challenges when managing coagulopathy.
