 multistage amplifier. US6208206B1 - Frequency compensation  
 techniques for low ... In electronics engineering, frequency  
 compensation is a technique used in amplifiers, and especially in  
 amplifiers employing negative feedback. It usually has two  
 primary goals: To avoid the unintentional creation of positive  
 feedback, which will cause the amplifier to oscillate, and to  
 control overshoot and ringing in the amplifier's step response. It  
 is also used extensively to improve the bandwidth of single pole  
 systems. Frequency compensation - Wikipedia

 technique for low-power operational amplifiers is presented in  
 this paper. With an active-feedback mechanism, a high-speed
