Multivariate statistical methods are used to analyze the joint behavior of more than one random variable. There are a wide range of multivariate techniques available, as may be seen from the different statistical method examples below. These techniques can be done using Statgraphics Centurion 18's multivariate statistical analysis. Multivariate Statistical Methods | Statgraphics Description. Test the hypothesis $H : \mu = 0$ against the alternative that each component of μ is greater than or equal to zero with strict inequality for at least one component. 4.9.17 A treatment was given to six subjects and their responses at times 0, 1, and 2 were recorded. M.S. Srivastava's Methods of Multivariate Statistics. Multivariate analysis consists of a collection of methods that can be used when several measurements are made on each individual or object in one or more samples. We

will refer to the measurements as variables and to the individuals or objects as units. (research units, sampling units, or experimental units) or observations. Methods of Multivariate Analysis 2 Ed-02--Rencher-p731--p1RX Multivariate statistics. The practical application of multivariate statistics to a particular problem may involve several types of univariate and multivariate analyses in order to understand the relationships between variables and their relevance to the problem being studied. Multivariate statistics - Wikipedia Overview. In order to understand multivariate analysis, it is important to understand some of the terminology. A variate is a weighted combination of variables. The purpose of the analysis is to find the best combination of weights. Nonmetric data refers to data that are either qualitative or categorical in nature. Although univariate and multivariate differ in function and complexity, the two methods of statistical analysis share similarities as well. Descriptive Methods. Although multivariate statistical methods emphasize correlation and explanation rather than description, researchers in business, education and the social sciences can use univariate and multivariate methods for descriptive purposes.
