There was a time when humanity looked in the mirror and saw something precious, worth protecting and fighting for—indeed, worth liberating. But now we are beset on all sides by propaganda promoting a radically different viewpoint. According to this idea, human beings are a cancer upon the Earth, a species whose aspirations and appetites are endangering the natural order. This is the core of antihumanism. Merchants of Despair traces the pedigree of this ideology and exposes its deadly consequences in startling and horrifying

detail. The book names the chief prophets and promoters of antihumanism over the last two centuries, from Thomas Malthus through Paul Ehrlich and Al Gore. It exposes the worst crimes perpetrated by the antihumanist movement, including eugenics campaigns in the United States and genocidal anti-development and population-control programs around the world. Combining riveting tales from history with powerful policy arguments, Merchants of Despair provides scientific refutations to antihumanism's major pseudo-scientific claims, including its modern tirades against nuclear power, pesticides, population growth, biotech foods, resource depletion, industrial development, and, most recently, fear-mongering about global warming.

Merchants of Despair exposes this dangerous agenda and makes the definitive scientific and moral case against it.

What Climate Science Tells Us, What It Doesn't, and Why It Matters Vintage Scientists and politicians are increasingly using the language of risk to describe the climate change challenge. Some researchers have argued that stressing the 'risks' posed by climate change rather than the 'uncertainties' can create a more helpful context for policy makers and a stronger response from the public. However, understanding the concepts of risk and uncertainty - and how to communicate them - is a hotly debated issue. In this book, James Painter analyses how the international media present these

and other narratives surrounding climate change. He focuses on the coverage of reports by the Intergovernmental Panel on Climate Change (IPCC) and of the melting ice of the Arctic Sea, and includes six countries: Australia, France, India, Norway, the UK and the USA.

In this book, we have hand-picked the most sophisticated, unanticipated, absorbing (if not at times crackpot!), original and musing book reviews of "Unstoppable Global Warming: Every 1,500 Years, Updated and Expanded Edition." Don't say we didn't warn you: these reviews are known to shock with their unconventionality or intimacy. Some may be startled by their biting sincerity; others may be spellbound by their unbridled flights of fantasy. Don't buy this book if: 1. You don't have nerves of steel. 2. You expect to get pregnant in the next five minutes. 3. You've heard it all.

Unstoppable Global Warming Every 1,500 Years Rowman & Littlefield Publishers

Hot Talk, Cold Science National Geographic Books

Explains why the environmental crisis should lead to an abandonment of "free market" ideologies and current political systems, arguing that a massive reduction of greenhouse emissions may offer a best chance for correcting problems.

IPCC Expose HarperCollins UK

An exposé of some of the more controversial agendas behind global warming argues that poor-quality science and dishonest politics are contributing to the intentionally disproportionate and self-serving levels of fear.

Climate Change Elsevier

In an era when many in the science community feel that science is under attack, *In Defense of Science* explains why ordinary citizens need to have an understanding of science, its methods, and its discoveries. The authors debunk several misconceptions of science and scientists, and advocate that science is an integral part of society.

Understanding Controversy, Inaction and Opportunity Unstoppable Global Warming Every 1,500 Years

"The Great Global Warming Blunder provides a simple explanation for why forecasts of a global warming Armageddon constitute a major scientific faux pas: climate researchers have mixed up cause and effect when they have analyzed cloud behavior. Combining illustrations from everyday experience with state-of-the-art

satellite measurements, Roy W. Spencer reveals how these scientists have been fooled by Mother Nature into believing that the Earth's climate system is very sensitive to humanity's production of carbon dioxide through the use of fossil fuels. He presents evidence that recent warming, rather than being the fault of humans, is a result of chaotic, internal natural cycles that have been causing periods of warming and cooling for thousands of years" --Cover, p. 2.

An Analysis of Some Key Questions Lennex

The warming of the Earth has been the subject of intense debate and concern for many scientists, policy-makers, and citizens for at least the past decade. *Climate Change Science: An Analysis of Some Key Questions*, a new report by a committee of the National Research Council, characterizes the global warming trend over the last 100 years, and examines what may be in store for the 21st century and the extent to which warming may be attributable to human activity.

Our Future on a Hotter Planet Verso Books

Singer and Avery present—in popular language supported by in-depth scientific evidence—the compelling concept that global temperatures have been rising mostly or entirely because of a natural cycle. Using historic data from two millennia of recorded history combined with the natural physical records found in ice cores, seabed sediment, cave stalagmites, and tree rings, *Unstoppable Global Warming* argues that the 1,500 year solar-driven cycle that has always controlled the earth's climate remains the driving force in the current warming trend. Trillions of dollars spent on reducing fossil fuel use would have no effect on today's rising temperatures. The public policy key, Singer and Avery propose, is adaptation, not fruitless attempts at prevention. Further, they offer convincing evidence that civilization's most successful eras have coincided with the cycle's warmest peaks. With the added benefit of modern technology, humanity can not only survive global climate change, but thrive. *The Stubborn Optimist's Guide to the Climate Crisis* Encounter Books

This book must not be ignored. It really is our final warning. Mark Lynas delivers a vital account of the future of our earth, and our civilisation, if current rates of global warming persist. And it's only looking worse.

Emerging Crises and Systemic Solutions Scribe Publications

In this groundbreaking, global analysis of the relationship between climate change and human health, Hans Baer and Merrill

Singer inventory and critically analyze the diversity of significant and sometimes devastating health implications of global warming. Using a range of theoretical tools from anthropology, medicine, and environmental sciences, they present ecosyndemics as a new paradigm for understanding the relationship between environmental change and disease. They also go beyond the traditional concept of disease to examine changes in subsistence and settlement patterns, land-use, and lifeways, throwing the sociopolitical and economic dimensions of climate change into stark relief. Revealing the systemic structures of inequality underlying global warming, they also issue a call to action, arguing that fundamental changes in the world system are essential to the mitigation of an array of emerging health crises link to anthropogenic climate and environmental change.

The NIPCC Report on Scientific Consensus Routledge

Shortlisted for the FT/McKinsey Business Book of the Year award A renowned climate scientist shows how fossil fuel companies have waged a thirty-year campaign to deflect blame and responsibility and delay action on climate change, and offers a battle plan for how we can save the planet. Recycle. Fly less. Eat less meat. These are some of the ways that we've been told can slow climate change. But the inordinate emphasis on individual behavior is the result of a marketing campaign that has succeeded in placing the responsibility for fixing climate change squarely on the shoulders of individuals. Fossil fuel companies have followed the example of other industries deflecting blame (think "guns don't kill people, people kill people") or greenwashing (think of the beverage industry's "Crying Indian" commercials of the 1970s). Meanwhile, they've blocked efforts to regulate or price carbon emissions, run PR campaigns aimed at discrediting viable alternatives, and have abdicated their responsibility in fixing the problem they've created. The result has been disastrous for our planet. In *The New Climate War*, Mann argues that all is not lost. He draws the battle lines between the people and the polluters-fossil fuel companies, right-wing plutocrats, and petrostates. And he outlines a plan for forcing our governments and corporations to wake up and make real change, including: A common-sense, attainable approach to carbon pricing- and a revision of the well-intentioned but flawed currently proposed version of the Green New Deal; Allowing renewable energy to compete fairly against fossil fuels

Debunking the false narratives and arguments that have worked their way into the climate debate and driven a wedge between even those who support climate change solutions. Combatting climate doomism and despair-mongering. With immensely powerful vested interests aligned in defense of the fossil fuel status quo, the societal tipping point won't happen without the active participation of citizens everywhere aiding in the collective push forward. This book will reach, inform, and enable citizens everywhere to join this battle for our planet.

The Environmental Triumph of High-yield Farming Rowman & Littlefield

An eye-opening and essential tour of the vanishing world. What if Atlantis wasn't a myth, but an early precursor to a new age of great flooding? Across the globe, scientists and civilians alike are noticing rapidly rising sea levels, and higher and higher tides pushing more water directly into the places we live, from our most vibrant, historic cities to our last remaining traditional coastal villages. With each crack in the great ice sheets of the Arctic and Antarctica, and each tick upwards of Earth's thermometer, we are moving closer to the brink of broad disaster. By century's end, hundreds of millions of people will be retreating from the world's shores as our coasts become inundated and our landscapes transformed. From island nations to the world's major cities, coastal regions will disappear. Engineering projects to hold back the water are bold and may buy some time. Yet despite international efforts and tireless research, there is no permanent solution - no barriers to erect or walls to build - that will protect us in the end from the drowning of the world as we know it. *The Water Will Come* is the definitive account of the coming water, why and how this will happen, and what it will all mean. As he travels across twelve countries and reports from the front lines, acclaimed journalist Jeff Goodell employs fact, science, and first-person, on-the-ground journalism to show vivid scenes from what already is becoming a water world. 'This harrowing, compulsively readable, and carefully researched book lays out in clear-eyed detail what Earth's changing climate means for us today, and what it will mean for future generations ... It's a thriller in which the hero in peril is us.' —John Green, bestselling author of *The Fault in Our Stars* 'Jeff Goodell grabs you on the first page and doesn't hold up until this essential story is told. He presents a vivid warning and a call to arms to the generation that gets to decide how fast, and how high, the

water will come.' —Scott Ludlam, former Australian Greens Senator 'A well-rounded, persuasive survey.... A frightening, scientifically grounded, and starkly relevant look at how climate change will affect coastal cities.' —Kirkus, Starred Review 'In this engaging book, environmental writer Goodell points out that while sea levels have always risen and fallen, the current rise is driven primarily by the dramatically accelerating melting of the arctic ice caps, and with so many cities on seashores, this will be devastating.' —Booklist, Starred Review [Every 1,500 Years](#) Regnery Publishing A cautionary but optimistic book about the world's changing climate and the fate of humanity, from Christiana Figueres and Tom Rivett-Carnac--who led negotiations for the United Nations during the historic Paris Agreement of 2015. The authors outline two possible scenarios for our planet. In one, they describe what life on Earth will be like by 2050 if we fail to meet the Paris Agreement's climate targets. In the other, they lay out what it will be like to live in a regenerative world that has net-zero emissions. They argue for confronting the climate crisis head-on, with determination and optimism. *The Future We Choose* presents our options and tells us what governments, corporations, and each of us can, and must, do to fend off disaster.

Simon and Schuster

In accessible journalistic prose, author Lynas distills what environmental scientists predict about the consequences of human pollution for the next hundred years, degree by degree. At 1 degree Celsius, most coral reefs and many mountain glaciers will belost. A 3-degree rise would spell the collapse of the Amazon rainforest, disappearance of Greenland's ice sheet, and the creation of deserts across the Midwestern United States and southern Africa. A 6-degree increase would eliminate most life on Earth, including much of humanity. Based on authoritative scientific articles, the latest computer models, and information about past warm events in Earth history, this promises to be an eye-opening warning that humanity will ignore at its peril.--From publisherdescription.

Climate Change in the Media University Press of America

Presents a history of science, focusing on its influence in the transition from humanity's primitive beginnings up to the modern day, with profiles of famous scientists responsible for some of the world's greatest scientific discoveries. -- Publisher's description.

The second edition of Dennis Averys 1995 seminal work, *Saving the Planet Through Pesticides and Plastics* provides the flip side to environmentalist cries of spiraling cancer rates, rising global temperatures and decreasing rainforest acreage.

Thoroughly updated and re-written with new information and data, Averys controversial book shows how agricultural technology can save the planet for both people and wildlife.

Is global warming just scaremongering by climatologists conspiring to protect their jobs? Is evolution "just a theory"? Is autism caused by vaccinations? The answer to all of these questions is, of course, no. The scientific evidence is now in, and it's conclusive, on these and many more issues that are fundamental to our knowledge and wellbeing. But you'd never know this if all of your information came from the popular media or your upbringing and immediate circle of influence didn't include critical thinking and basic scientific literacy. As this witty book with a very serious message shows, our culture has in recent decades been characterized by a widespread antagonism toward science and the not-always-welcome messages it brings. Large sections of the supposedly sophisticated populations in the developed nations are in an active state of denial. Not only do they deny scientific evidence but they also call into question the very competence of science as a descriptor of reality. In short, they deny reality. The author surveys the gamut of clearly unscientific ideas concerning the food we eat, the medicines and potions we are either afraid of or advised to take, our sex preferences, and a host of other issues that are raised by various panics, urban legends, and a general climate of misinformation. He also examines how special interests, from agribusiness to pharmaceutical companies to creationists, actively work to distort or suppress scientific findings. While the tendency may be to laugh at some of the ridiculous notions catalogued in the author's overview of bogus ideas, the overall picture he creates is anything but funny. This book reminds the reader that the future of free, increasingly complex societies depends on an educated citizenry that is able to think clearly and critically based on reliable information. [Red Hot Lies](#) Chronicle Books Global warming and human-induced climate change are perhaps the most important scientific issues of our time. These issues continue to be debated in the scientific community and in the media

without true consensus about the role of greenhouse gas emissions as a contributing factor. Evidence-Based Climate Science: Data opposing CO2 emissions as the primary source of global warming objectively gathers and analyzes scientific data concerning patterns of past climate changes, influences of changes in ocean temperatures, the effect of solar

variation on global climate, and the effect of CO2 on global climate to clearly and objectively present counter-global-warming evidence not embraced by proponents of CO2. An unbiased, evidence-based analysis of the scientific data concerning climate change and global warming Authored by 8 of the

world's leading climate scientists, each with more than 25 years of experience in the field Extensive analysis of the physics of CO2 as a greenhouse gas and its role in global warming Comprehensive citations, references, and bibliography Adaptation strategies are presented as alternative reactions to greenhouse gas emission reductions
