MATHEMATICAL ECONOMICS AND ECONOMETRICS Mathematical economics is the application of mathematical methods to represent theories and analyze problems in economics. By convention, these applied methods are beyond simple geometry, such as differential and integral calculus, difference and differential equations, matrix algebra, mathematical programming, and other computational methods. Mathematical economics - Wikipedia In mathematics, extrapolation is a type of estimation, beyond the original observation range, of the value of a variable on the basis of its relationship with another variable. It is similar to interpolation, which produces estimates between known observations, but extrapolation is subject to greater uncertainty and a higher risk of producing meaningless results. Extrapolation - Wikipedia by problems in economics, and I'll suggest to you that some of the new mathematical methods of economics might come into your own teaching and research. One of these methods is called linear programming. I learned about it in 1958. I had just come to Caltech as a junior faculty member associated with the computing center.
