 The first two books of the Physics are Aristotle's general introduction to the study of nature. The remaining six books treat physics itself at a very theoretical, generalized level, culminating in a discussion of God, the First Cause.  
 Summary. The Physics opens with an investigation into the principles of nature. At root, there must be a certain number of

basic principles at work in nature, according to which all natural processes can be explained.  
 SparkNotes: Aristotle (384–322 B.C.): Physics: Books I to IV  
 Physics is a treatise by Aristotle in which he deals with the study of Nature, or rather, how we should study Nature. This comprises not just physics in the modern sense, but all things in the world - so to use modern phraseology Aristotle views the study of Nature to be the domain of physics, biology, even psychology.

 It is evident that for Aristotle, however, an object is considered befitting of circular motion by virtue of its composition not of its form, specifically, that of the fifth element or 'aither', which is eternal and indestructible, unchanging and like the circle without beginning or end. Does Aristotle indicate elsewhere that this is not so?
