 Spinal instrumentation, also known as spinal implants, devices or hardware, uses surgical procedures to implant titanium, titanium-alloy, stainless steel, or non-metallic devices into the spine. Instrumentation provides a permanent solution to spinal instability. What Is Spinal Instrumentation and Spinal Fusion  
 Spinal instrumentation is a method of keeping the spine rigid after spinal fusion surgery by surgically attaching hooks, rods, and wire to the spine in a way that redistributes the stresses on the bones and keeps them in proper alignment while the bones of the spine fuse. Spinal Instrumentation - procedure, recovery, blood, pain ...  
 Spinal Instrumentation: Surgical Techniques. Provides a complete guide to all contemporary forms of spinal implant systems. It not only highlights the newest devices, but also the clinical guidelines needed to choose and apply the best implant for any surgical situation. Spinal Instrumentation: Surgical Techniques - Richard G ...  
 Spinal instrumentation is a method of keeping segments of the spine immobile after spinal fusion surgery. During this procedure, the surgeon inserts screws and rods to the spine to keep the bones in alignment while the bone graft heals and they fuse together. Types of Minimally Invasive Spine Surgery - MedStar  
 Dorsal Thoracolumbar Instrumentation. In 1975, the Harrington rod represented the state of the art in spinal instrumentation. The rod system, originally developed by Paul Harrington for the correction of spinal deformities, was soon used in the treatment of traumatic injuries 1, 2 ( ), degenerative disease, 3 and metastatic disease. 4, 5 The system provided distraction rods as well as ...

 Mercian have a programme of spinal retractors for improved access and allow for smaller more precise incisions for surgery in both the lumbar and cervical approach. The Black Belt Cervical Retractor is the leading retractor used in the anterior cervical approach and has proved to be a very popular system. Spinal Instruments | Mercian Surgical  
 Lumbar Spine Fusion and Instrumentation. Rigid internal fixation (spinal instrumentation) is necessary to promote bone fusion, which occurs within

4–5 months after spinal fusion surgery, and to prevent pseudarthrosis (3). Lumbar spinal fusion involves the insertion of bone graft material with or without one or more interbody spacers
