This second edition of the highly acclaimed and successful first edition, deals primarily with the analysis of structural engineering systems, with applicable methods to other types of structures. The concepts presented in the book are not only relevant to skeletal structures but can equally be used for the analysis of other systems such as hydraulic and electrical networks. The book has been substantially revised to include recent developments and applications of the algebraic graph theory and matroids.

The theory and application of structural analysis are presented as it applies to trusses, beams, and frames in this book/CD-ROM text. Emphasis is placed on developing the student's ability to both model and analyze a structure and on providing realistic applications encountered in professional practice. In each chapter, discussion of theory is followed by a summary of important concepts and a systematic approach for applying the theory. Example problems are solved using this method in order to clarify its numerical application. Chapter problems are given in sequential order of material covered, and arranged in order of difficulty. Classical methods of problem solving are emphasized over computerized matrix methods, but the CD-ROM supplies the STRAN computer program for checking answers to problems.

solution of structural dynamics problems is introduced in this new edition. This program was selected from among the various professional programs available because of its capability in solving complex problems in structures as well as its wide use in professional practice by structural engineers. SAP2000 includes routines for the analysis and design of structures with linear or nonlinear behavior subjected to static or dynamics loads; (material non-linearity or large displacements non-linearities) and may be used most efficiently in the microcomputer. The larger versions of SAP2000 have the capability for the analysis of structures modeled with virtually any large number of nodes. This new fifth edition of the book uses, almost exclusively, the introductory version of SAP2000 which has a capability limited to 25 nodes or 25 elements. A CD ROM containing the introductory version of SAP2000 as well as the educational set of the program developed by the author is included in this 5 edition of Structural Dynamics: Theory and Computation. The set of educational programs in Structural Dynamics includes programs to determine the response in the time domain or in the frequency domain using the FFT (Fast Fourier Transform) of structures modeled as a single oscillator. Also included is a program to determine the response of an inelastic system with elastoplastic behavior, and another program for the development of seismic response spectral charts.

Matrix Structural Analysis John Wiley & Sons

Structural analysis, or the 'theory of structures', is an important subject for civil engineering students who are required to analyse and design structures. It is a vast field and is largely taught at the undergraduate level. A few topics, such as matrix method and plastic analysis, are also taught at the postgraduate level and in structural engineering electives. The entire course has been covered in two volumes: Structural Analysis-I and Structural Analysis-II. Structural Analysis-II not only deals with the in-depth analysis of indeterminate structures but also special topics, such as curved beams and unsymmetrical bending. The book provides an introduction to advanced methods of analysis, namely, matrix method and plastic analysis.
