Birds of Western and Central Africa Pocket Naturalist Guide

This new field guide uses all 147 color plates from Princeton's *A Guide to the Birds of Western Africa*, with concise, authoritative text on facing pages, to create a compact, lightweight field reference covering all 1,285 species found in the region--from Senegal and southern Mauritania east to Chad and the Central African Republic and south to Congo. It is the first field guide to cover this region exclusively and in such comprehensive depth, and will enable birders to identify any species found in any of the twenty-three countries and territories covered. *Birds of Western Africa* also has an updated color distribution map for each species, conveniently placed on interleaved pages within the color plates. The plates, all original and painted by the same leading illustrator, comprise over 3,000 figures--including a number of new images painted for this field guide--and depict almost all the species described. The entries opposite the plates focus on key identification marks for all main plumages. Both authors have gained extensive field experience over many years in western Africa. Their knowledge and expertise shines through in this unprecedented and outstanding field guide to one of the world's most exciting birding regions.

South Africa's Kruger National Park is one of the largest and most iconic conservation areas in Africa. Habitats range from wide-open savannah and

rugged thornveld to broadleaved mopani woodland. This microhabitat variation gives Kruger a phenomenal diversity of some 520 bird species, half of which are resident. From Africa's most extraordinary eagles, like the scarlet-faced Bateleur, to electric-colored glossy-starlings and jewel-like finches, Kruger offers an avian celebration of form and color. It is also a crucial conservation area, supporting South Africa's largest viable populations of vultures, eagles, and large terrestrial birds. This field guide offers a unique window into the world of Kruger's birds. More than 500 stunning color photographs illustrate the 259 most frequently encountered species, and a habitat-based approach assists in identification. The authoritative text provides key information about identification, habitat, behavior, biology, and conservation. The guide contains information likely to be new to even the most experienced birders, but is written in a nontechnical style that makes it accessible to anyone. How birds have evolved and adapted to survive winter *Birds in Winter* is the first book devoted to the ecology and behavior of birds during this most challenging season. Birds remaining in regions with cold weather must cope with much shorter days to find food and shelter even as they need to avoid predators and stay warm through the long nights, while migrants to the tropics must fit into very different ecosystems and communities of resident birds. Roger Pasquier explores how winter affects birds' lives all through the year, starting in late summer, when some begin caching food to retrieve months later and others form social groups lasting into the next spring. During winter some birds are already pairing up for the following breeding season, so health through the winter contributes to nesting success. Today, rapidly advancing technologies are enabling scientists to track individual birds through their daily and annual movements at home and across oceans and hemispheres, revealing new and unexpected information about their lives and interactions. But, as *Birds in Winter* shows, much is visible to any interested observer. Pasquier describes the season's distinct conservation challenges for birds that winter where they have bred and for migrants to distant regions. Finally, global warming is altering the nature of winter itself. Whether birds that have evolved over millennia to survive this season can now adjust to a rapidly changing climate is a problem all people who enjoy watching them must consider. Filled with elegant

line drawings by artist and illustrator Margaret La Farge, *Birds in Winter* describes how winter influences the lives of birds from the poles to the equator.
