estimation, and
landmark estimation.
However, there is a

rich history of all three in vision. Space does not allow for a full review; we refer the reader to the recent surveys [42,27,40]. We focus on methods most related to ours. Face detection is dominated by discriminatively-trained Face Detection, Pose Estimation, and Landmark Localization ... We present a unified model for face detection, pose estimation, and landmark estimation in real-world, cluttered images. Our model is based on a mixtures of trees with a shared pool of parts; we model every facial landmark as a part and use global mixtures to capture topological changes due to viewpoint. We show that tree-structured models are surprisingly effective at capturing

global elastic deformation, while being easy to optimize unlike dense graph structures. Face Detection, Pose Estimation and Landmark Localization ... Pros: • Model the view-specific within mixtures of trees. • Joint method to do face detection, pose estimation, and landmarks localization for face images with viewpoint variations and elastic deformation. Conclusions. Cons: • Slow in the inference, given one image (80*80), it takes more than 20 seconds to process. Face detection, pose estimation and landmark localization ... Face detection and pose estimation are two widely studied problems – mainly

because of their use as subcomponents in important applications, e.g. face recognition. In this thesis I investigate a new approach to the general problem of object detection and pose estimation and apply it to faces. Face Detection and Pose Estimation using Triplet Invariantsnovation of the proposed framework is twofold: 1) we propose the use of multiple face detection experts to provide input to a bounding box aggregation strategy to improve the accuracy of face detection; 2) we divide the original CSR method into a number of coarse-to-fine steps that further improve the accuracy of facial landmark localisation. Face Detection, Bounding Box Aggregation and

Pose ... Given an image, detecting a face and estimating its pose is viewed as minimizing an energy function with respect to the face/non-face binary variable and the continuous pose parameters. The system is trained to minimize a loss function that drives correct combinations of labels and Synergistic Face Detection and Pose Estimation with Energy ... We present a unified model for face detection, pose estimation, and landmark estimation in real-world, cluttered images. Our model is based on a mixture of trees with a shared pool of parts; we model every facial landmark as a part and use global mixtures to capture topological changes due to

viewpoint. We show that tree-structured models are surprisingly effective at capturing global elastic deformation, while being easy to optimize unlike dense graph structures. CiteSeerX — Face detection, pose estimation, and landmark ... Abstract: We present an algorithm for simultaneous face detection, landmarks localization, pose estimation and gender recognition using deep convolutional neural networks (CNN). The proposed method called, HyperFace, fuses the intermediate layers of a deep CNN using a separate CNN followed by a multi-task learning algorithm that operates on the fused features. HyperFace: A Deep Multi-Task

Learning Framework for Face ... Abstract: Images containing faces are essential to intelligent vision-based human-computer interaction, and research efforts in face processing include face recognition, face tracking, pose estimation and expression recognition. However, many reported methods assume that the faces in an image or an image sequence have been identified and localized. To build fully automated systems that analyze the information contained in face images, robust and efficient face detection algorithms are required. Detecting faces in images: a survey - IEEE Journals & Magazine OpenFace - a state-of-the art tool intended for facial

landmark detection, head pose estimation, facial action unit recognition, and eye-gaze estimation. head-pose-estimation · GitHub Topics · GitHub Face detection and face direction estimation are important for face recognition. In personal identification with surveillance cameras, for example, it is necessary to detect the face whose size, position, and pose are unknown.
