Sintering is a method for manufacturing components from ceramic or metal powders by heating the powder until the particles adhere to form the component required. The resulting products are characterised by an enhanced density and strength, and are used in a wide range of industries. Sintering of advanced materials: fundamentals and processes reviews important developments in this technology and its applications Part one discusses the fundamentals of sintering with chapters on topics such as the thermodynamics of sintering, kinetics and mechanisms of densification, the kinetics of microstructural change and liquid phase sintering. Part two reviews advanced sintering processes including atmospheric sintering, vacuum sintering, microwave sintering, field/current assisted sintering and photonic sintering. Finally, Part three covers sintering of aluminium, titanium and their alloys, refractory metals, ultrahard materials, thin films, ultrafine and nanosized particles for advanced materials. With its distinguished editor and international team of contributors, Sintering of advanced materials: fundamentals and processes reviews the latest advances in sintering and is a standard reference for researchers and engineers involved in the processing of ceramics, powder

metallurgy, net-shape manufacturing and those using advanced materials in such sectors as electronics, automotive and aerospace engineering. Explores the thermodynamics of sintering including sinter bonding and densification

Sir John Franklin's Arctic expedition departed England in 1845 with two Royal Navy bomb vessels, 129 men and three years' worth of provisions. None were seen again until nearly a decade later, when their bleached bones, broken instruments, books, papers and personal effects began to be recovered on Canada's King William Island. These relics have since had a life of their own--photographed, analyzed, cataloged and

displayed in glass cases in London. This book gives a definitive history of their preservation and exhibition from the Victorian era to the present, richly illustrated with period engravings and photographs, many never before published. Appendices provide the first comprehensive accounting of all expedition relics recovered prior to the 2014 discovery of Franklin's ship HMS Erebus.

The task of continuously renewing a company is the greatest challenge confronting any chief executive. To enable managers to project renewal strategies likely to win in the future, Jeffrey Williams has constructed a dynamic road map of outcomes in what he calls "economic time," based on a ten-year study of growth, decline, and

renewal patterns of hundreds of companies in forty-five industries. In this superbly readable book, Williams's revolutionary, award-winning concept of slow-, standard-, and fast-cycle economic time provides a unifying business language that the multicycle manager can use to compare the renewal opportunities of widely diverse products, companies, and markets.

Using examples and studies from companies such as Starbucks, McDonald's, UPS, Compaq, Sony, Merck, Disney, Toyota, IKEA, Microsoft, Sony, Intel, IBM, Johnson & Johnson, Chrysler, and Hewlett-Packard, Williams explains that the key idea in economic time is being able to manage products and organizations according to the speed and means by which economic value arises, decays, and is renewed. The drivers of economic time are isolating mechanisms -- a firm's unique capabilities that lie at the heart of its competitive advantage -- and that, in Williams's framework, "delay" product obsolescence. Building on his intuitively appealing model, Williams describes how his three laws of renewal -- convergence, alignment, and renewal -- provide guidelines by which managers can gain command over strategy in complex, dynamic competitive situations. Renewable Advantage is not only essential reading but also will become a standard reference for senior and division managers, business scientists and strategists, and general managers in all industries.

Lemon-Aid guides steer the confused and anxious buyer through the economic meltdown unlike any other car-and-truck

books on the market. U.S. automakers are suddenly awash in profits, and South Koreans and Europeans have gained market shares, while Honda, Nissan, and Toyota have curtailed production following the 2011 tsunami in Japan. Shortages of Japanese new cars and supplier disruptions will likely push used car prices through the roof well into 2012, so what should a savvy buyer do? The all-new Lemon-Aid Used Cars and Trucks 2012-2013 has the answers, including: More vehicles rated, with some redesigned models that don't perform as well as previous iterations downrated. More roof crash-worthiness ratings along with an expanded cross-border shopping guide. A revised summary of safety- and performance-related defects that are likely to affect rated models. More helpful websites listed in the appendix as well as an updated list of the best and worst "beaters" on the market. More "secret" warranties taken from automaker internal service bulletins and memos than ever.

The Cadillac Northstar V-8 Elsevier Cadillac has had a long history in the automotive marketplace as General Motors' luxury car division. During the 1980s, Cadillac's management wanted to reestablish the brand as a leader in sophistication, innovation, refinement and prestige. Engineers conceived a new dual-overhead cam, four-valve-per-cylinder V-8 engine--the Northstar. This power plant was the heart of Cadillac's Northstar System, which included a greatly improved suspension and braking system. The division redesigned its entire line to incorporate these new technologies for the 1990s and beyond. The Northstar was the last engine designed and built by Cadillac before the 2005 establishment of GM Powertrain,

which took over engine design for all GM divisions. This history of the Northstar V-8 and the cars it powered covers the first generation front-wheel drive Northstar, the second generation rear-wheel drive model, and the supercharged version, along with racing history and the most collectible Northstar-powered Cadillacs.
