The Manual of Pulmonary Surgery has been designed primarily as a guide to the techniques of surgery on the lungs of

adults and older children. The information included and the technical points stressed are those in which, in more than 20 years of teaching thoracic surgery, I have found residents to most commonly need instruction. An effort has been made to depict the usual anatomy of the lung and its more frequent variations, as it is encountered by the surgeon. This was necessary because a detailed description of pulmonary anatomy is not readily available. The excellent monograph on Segmental Anat omy of the Lung by Professor Edward Boyden, one of my

teachers, is no longer in print. The techniques illustrated are those preferred by the author; no attempt has been made to describe all of the possible variations. Deanne McKeown has illustrated the entire book. Her drawings of the procedures are based on sketches or photographs made in the operating room. The use of full color illustrations to emphasize important technical or anatomical detail adds to the ease of understanding the text. A section on the indications for pulmonary resection that contains the information commonly used for surgical decision-making has been included.

This document describes the implementation level changes in the source code and input files of Sandia National Laboratories Environmental Fluid Dynamics Code (SNL-EFDC) that are necessary for including pH effects into algae-growth dynamics. The document also gives a brief introduction to how pH effects are modeled into the algae-growth model. The document assumes that the reader is aware of the existing algae-growth model in SNL-EFDC. The existing model is described by James, Jarardhanam and more theoretical considerations behind modeling pH effects are presented therein. This document should be used in conjunction with the original EFDC manual and the original water-quality manual.

The term "zooplankton" describes the community of floating, often microscopic, animals that inhabit aquatic environments. Being near the base of the food chain, they serve as food for larger animals, such as fish. The ICES (International Council for the Exploration of the Sea) *Zooplankton Methodology Manual* provides comprehensive coverage of modern techniques in zooplankton ecology written by a group of international experts. Chapters include sampling, acoustic and optical methods, estimation of feeding, growth, reproduction and metabolism, and up-to-date treatment of population

genetics and modeling. This book will be a key reference work for marine scientists throughout the world. Sampling and experimental design Collecting zooplankton Techniques for assessing biomass and abundance Protozooplankton enumeration and biomass estimation New optical and acoustic techniques for estimating zooplankton biomass and abundance Methods for measuring zooplankton feeding, growth, reproduction and metabolism Population genetic analysis of zooplankton Modelling zooplankton dynamics This unique and comprehensive reference work will be essential reading for marine and freshwater research scientists and graduates entering the field.
