Tax Policy Emerald Group Publishing The research papers in Volume 30 of Tax Policy and the Economy make significant contributions to the academic literature in public finance and provide important conceptual and empirical input to policy design. In the first paper, Gerald Carlino and Robert Inman consider whether state-level fiscal policies create spillovers for neighboring states and how federal stimulus can internalize these externalities. The second paper, by Nathan Hendren, presents a new framework for evaluating the welfare consequences of tax policy changes and explains how the key parameters needed to implement this framework can be estimated. The third paper, a collaborative effort by several academic and US Treasury economists, documents the dramatic increase in pass-through businesses, including partnerships and S-corporations, over the last thirty years. It notes that these entities now generate more than half of all US business income. The fourth paper examines property tax compliance using a pseudo-randomized experiment in Philadelphia, in which those who owed taxes received supplemental letters regarding their tax delinquency. The research explores what types of communication lead to higher rates of tax payment. In the fifth paper, Jeffrey Clemens discusses cross-program budgetary spillovers of minimum wage regulations. Severin Borenstein and Lucas Davis, the authors of the sixth paper, study the distributional effects of income tax credits for clean energy.

The growing integration of world markets for capital and goods, coupled with the rise of instantaneous worldwide communication, has made identification of corporations as "American," "Dutch," or "Japanese" extremely difficult. Yet tax treatment does depend of where a firm is chartered. And, as Borderline Case documents, there is little doubt that tax rules for firms doing business in several nationsâ€"firms that account for more than three-quarters of corporate R&D spending in the United

Statesâ€"have substantial effects on corporate decisionmaking and, ultimately, U.S. competitiveness. This book explores the impact of the U.S. tax code and its incentives on the international activities of U.S.- and foreign-based firms: basic research outlays, expenditures on product and process development, and plant and equipment investment. The authors include industry experts from large multinational firms in technology and pharmaceuticals, academic researchers who have explored the quantitative impact of tax provisions on R&D, and tax policy analysts who have examined international tax rules in the broader context of tax reform. These experts look at how corporate investment and R&D are shaped by specific tax provisions, such as the definition of taxable income, relative tax burdens on domestic and foreign business, taxation of earnings repatriated to the United States, deductibility of expenses of worldwide operations, and U.S. corporate taxes relative to other countries. The volume explores prescriptions and prospects for tax reform and reviews major reform proposals and their implications for the behavior of multinational business.

Two others employ experimental methods using taxpayer/practitioner subjects. In addition, two use quasi-experimental empirical analyses. Of the last two articles, one uses survey methods, and the last is a review article.

Fed. assistance helps students & families pay for postsecondary ed. through several policy tools -- grant & loan programs authorized by title IV of the Higher Ed. Act of 1965 & more recently enacted tax preferences. In FY 2004, about $14 billion in grants & $56 billion in loans were made under Title IV while estimated outlay equivalents for postsecondary tax preferences amounted to $10 billion. In light of the relative newness & financial significance of tax preferences, this report examines: (1) how Title IV assistance compares to that provided through the tax code; (2) the extent to which tax filers effectively use postsecondary tax preferences; & (3) what is known about the effectiveness of fed. assistance. Technological innovation is a primary engine of long-term economic growth, and research and development (R&D) serves as the lifeblood of innovation. The federal government encourages businesses to invest more in R&D than they otherwise would in several ways, including a tax credit for increases in spending on qualified research above a base amount. This report describes the current status of the credit, summarizes its legislative history, discusses policy issues it raises, and describes legislation to modify and extend it. The report will be updated as warranted by legislative activity or other developments affecting the credit. The research credit (also known as the research and experimentation (R&E) tax credit) has never been permanent. It expired at the end of 2014. Since its enactment in mid-1981, the credit has been extended 16 times and significantly modified 5 times. While the credit is usually assumed to be a single credit, it actually consists of four discrete credits: (1) a regular credit, (2) an alternative simplified credit (ASC), (3) a basic research credit, and (4) an energy research credit. A taxpayer may claim one of the first two and each of the other two, provided it meets the requirements for each. In essence, the research credit attempts to boost business investment in basic and applied research by reducing the after-tax cost of undertaking qualified research above a base amount, which in theory approximates the amount a company would invest in R&D in the absence of the credit. As a result, the credit's effectiveness hinges on the sensitivity of the demand for this research to decreases in its cost. It is unclear from available studies how sensitive that demand actually is. While most analysts and lawmakers endorse the use of tax incentives to generate increases in business R&D investment, some have some reservations about the current credit. Critics contend that it is not as effective as it could or should be because of certain problems with its design. These include a lack of permanence, uneven and inadequate incentive effects, non-refundability, and an ambiguous definition of qualified research. In the 113th Congress, the House passed two bills (H.R. 4438, the American Research and Competitiveness Act of 2014, and H.R. 4, the Jobs for America Act) that would simplify and permanently extend the research tax credit. While the full Senate did not pass a similar measure, the Senate Finance Committee marked up S. 2260, the Expiring Provisions Improvement, Reform, and Efficiency Act. Among other things, the bill would extend the existing research credit through the end of 2015 and allow eligible small companies to apply up to $250,000 of any credit they could claim for the current tax year but not use because of insufficient tax liability against their federal payroll tax liabilities.

In this paper we use an instrumental variable estimator to exploit sources of independent variation, which allows unbiased estimation of the tax-price elasticity under more general conditions. The estimator is applied to the demand for charitable giving. A charitable giving equation is an appropriate test for this procedure because it represents the purest case of a tax-price coefficient. That is, taxes are the sole source of variance in the price. The deduction is also an important policy issue. In 1982, 1.8 percent of gross income was deducted for this reason, about as much as the capital gains deduction.

The debates about the what, who, and how of tax policy are at the core of politics, policy, and economics. The Economics of Tax Policy provides a straightforward overview of recent research in the economics of taxation. Tax policies generate considerable debate among the public, policymakers, and scholars. These disputes have grown more heated in the United States as the incomes of the wealthiest 1 percent and the rest of the population continue to diverge. This important volume enhances understanding of the implications of taxation on behavior and social outcomes by having

leading scholars evaluate key topics in tax policy. These include how changes to the individual income tax affect long-term economic growth; the challenges of tax administration, compliance, and enforcement; and environmental taxation and its effects on tax revenue, pollution emissions, economic efficiency, and income distribution. Also explored are tax expenditures, which are subsidy programs in the form of tax deductions, exclusions, credits, or favorable rates; how college attendance is influenced by tax credits and deductions for tuition and fees, tax-advantaged college savings plans, and student loan interest deductions; and how tax policy toward low-income families takes a number of forms with different distributional effects. Among the most contentious issues explored are influences of capital gains and estate taxation on the long term concentration of wealth; the interaction of tax policy and retirement savings and how policy can "nudge" improved planning for retirement; and how the reform of corporate and business taxation is central to current tax policy debates in the United States. By providing overviews of recent advances in thinking about how taxes relate to behavior and social goals, The Economics of Tax Policy helps inform the debate.

Not everyone complies with the United States Internal Revenue Code. Many individuals and organizations fail to file timely tax returns, assess their tax liability correctly, or pay taxes when due. To improve compliance, tax administrators must choose among alternative strategies, such as increasing evaders' risks of punishment, motivating social norms, and making compliance easier. Concerned with these choices, the IRS asked the National Academy to assess previous research on the determinants of taxpayer compliance and to highlight the most promising areas for future research. The Academy's panel authored the two-volume Taxpayer Compliance. Volume 2 is a collection of eight background papers commissioned by the panel. They present novel theories and research ideas proposed by scholars from many social sciences to improve the understanding of taxpayer compliance. The varied topics addressed include: the political and institutional context of the American tax system; a typology of noncompliance; a study of the way the visibility of noncompliance affects patterns of taxpaying in the house-painting profession; and theories of ways tax

practitioners may affect their clients' compliance. These papers not only illustrate for a general audience what various disciplines can add to knowledge but also suggest for specialized researchers the opportunities that taxpayer compliance offers for extending and testing the theories of their disciplines. Taxpayer Compliance will be a valuable reference for tax practitioners and others concerned with noncompliance problems, and for scholars and students of law and sociology, political science, social psychology, and economics.

In 1981, Congress created the research tax credit to encourage business to do more research. Since its enactment on a temporary basis in 1981, the credit has been extended six times and modified four times. This report evaluates several recent studies of the effectiveness of the research tax credit to determine whether the studies provide adequate evidence to conclude that each dollar taken of the tax credit stimulates at least $1.00 of research spending in the short run, and about $2.00 of research spending in the long run.

Federal Tax Research University of Chicago Press
The major sources of federal tax revenue are individual income taxes, Social Security

and other payroll taxes, corporate income taxes, excise taxes, and estate and gift taxes. This report describes the federal tax structure, provides some statistics on the tax system as a whole, and presents analysis of selected tax concepts. The federal income tax is levied on an individual's taxable income, which is adjusted gross income (AGI) less deductions and exemptions. Tax rates, based on filing status (e.g., married filing jointly or single individual) determine the level of tax liability. Tax rates in the United States are progressive, such that higher levels of income are taxed at higher rates. Once tax liability is calculated, tax credits can be used to reduce tax liability. Tax deductions and tax credits are tools available to policymakers to increase or decrease the after-tax price of undertaking specific activities. Individuals with high levels of exemptions, deductions, and credits relative to income may be required to file under the alternative minimum tax (AMT). Corporate taxable income is also subject to varying rates, where those with higher levels of income pay higher levels of taxes. Social Security and Medicare tax rates are, respectively, 12.4% and 2.9%. In 2014, Social Security taxes are levied on the first $117,000 of wages. In 2015, the Social Security wage base is inflation-adjusted to $118,500, reflecting increases in average wages in the economy. Medicare taxes are assessed against all wage income. Federal excise taxes are levied on specific goods, such as transportation fuels, alcohol, tobacco, and telephones. In FY2013, individual income taxes accounted for 47% of total federal revenue. Social Security taxes accounted for 34%. Corporate income taxes accounted for 10% while excise taxes accounted for 3%. Estate and gift, customs, and miscellaneous taxes accounted for the remaining 6% of total revenue. Over time, the corporate income tax has become much less important as a revenue source while Social Security taxes have provided a larger share of total revenues. Analysis of tax statistics from the federal tax system as a whole leads to three conclusions: (1) federal revenue as a percentage of GDP is in line with historical trends; (2) the U.S. fiscal position is in line with the fiscal position of other industrialized nations (revenues and expenditures as a percentage of GDP are relatively low); and (3) over the past decade, average tax rates have fallen for individuals at all income levels, but have fallen more for lower-income individuals, reducing their share of overall tax liabilities. The final sections of this report analyze a number of tax concepts. Tax expenditures are revenue losses from special tax deductions, credits, and other benefits. Capital gains warrant special attention, as there is debate about their being taxed at a lower rate. Marriage tax penalties and bonuses, while reduced following legislation enacted in 2001 and 2003, still pose an inequity in the tax system. Tax deferral, or the timing of taxes, poses problems related to the timing of taxation, specifically with respect to capital gains. Depreciation is important, as accelerated depreciation schemes or expensing can influence firm behavior. Tax liability also depends on form of business organization. Finally, the issue of whether taxes can influence firms' competitiveness is reviewed.

Since its enactment in mid-1981, the credit has been extended 15 times and significantly modified 5 times. While the credit is usually assumed to be a single credit, it actually consists of four discrete credits: (1) a regular credit, (2) an alternative simplified credit (ASC), (3) a basic research credit, and (4) an energy research credit. Under each measure, the credit would be equal to the sum of 20% of a taxpayer's qualified research expenditures (QREs) in the current tax year above 50% of average annual QREs in the previous three tax years, 20% of its basic research payments in the current tax year above 50% of average annual basic research payments in the three previous tax years, and 20% of the amounts paid or incurred by the taxpayer in the current tax year for qualified energy research conducted by an energy research consortium. The bills' estimated 10-year revenue cost is $155.5 billion. On April 3, the Senate Finance Committee marked up S. 2260, the Expiring Provisions Improvement, Reform, and Efficiency Act. Among other things, the bill would extend the existing research credit through the end of 2015. It would also change its design by allowing small, young companies that are unable to use some or all of any credit they could claim for the current tax year because of insufficient tax liability to apply up to $250,000 of their credit against their federal payroll tax liabilities. This option would be available only to companies that have been in business fewer than five years and whose annual gross receipts are less than $5 million.
