Written to help trainee ophthalmologists, this textbook is now the recognised text on optics for the examinations of the Royal College of Ophthalmologists and the Royal Surgical Colleges. It

approaches the subject from first principles and assumes no previous knowledge of optics. The book has been kept as simple as possible and is liberally complemented with diagrams designed to

be easily understood and memorised. Only the most fundamental and clinically useful mathematical formulae are quoted, and the optical principles are applied to clinical situations. Ophthalmology examinations have changed substantially since the last edition was written and a total rewrite of this essential guide has become necessary. The third edition has been made more comprehensive and detailed to keep up with these changes and incorporates three new chapters: refractive surgery, contact lenses and lasers. Other new material includes photometry, visual acuity, contrast sensitivity, colour vision, absorptive lenses, fluorescence, ultrasound, and the specular microscope.

This fascinating book provides a stimulating introduction to analog electronics by analysing the design and construction of a radio transceiver. Essential theoretical background is given along with carefully designed laboratory and homework exercises. The author begins with a thorough description of basic electronic components and simple circuits and goes on to describe the key elements of radio electronics, including filters, amplifiers, oscillators, mixers, and antennas. Laboratory exercises lead the reader through the design, construction, and testing of a popular radio transceiver (the NorCal 40A). A diskette containing the widely known circuit simulation software, Puff, is included in the book. This was the first book to deal with elementary electronics in the context of radio. It can be used as a textbook for introductory analog electronics courses, for more advanced undergraduate classes on

radio-frequency electronics, and will also be of great interest to electronics hobbyists and radio enthusiasts.

The field of optics has changed greatly in the past dozen years or so. Partly because of the applied or engineering nature of much of modern optics, there is need for a practical text that surveys the entire field. Such a book should not be a classical-optics text, but, rather, it should be strong on principles, applications and instrumentation, on lasers, holography and coherent light. On the other hand, it should concern itself relatively little with such admittedly interesting phenomena as the formation of the rainbow or the precise determination of the speed of light. My purpose, therefore, has been to write an up-to-date textbook that surveys applied or engineering optics, including lasers and certain other areas that

might be called modern optics. I have attempted to treat each topic in sufficient depth to give it considerable engineering value, while keeping it as free of unnecessary mathematical detail as possible. Because I have surveyed applied optics in a very general way (including much more than I would attempt to incorporate into any single college course), this book should be a useful handbook for the practicing physicist or engineer who works from time to time with optics. Any of the material is appropriate to an introductory undergraduate course in optics; the work as a whole will be useful to the graduate student or applied scientist with scant background in optics.

Imaging and Technology: Principles and Clinical Applications is a practical and user-friendly consolidated source book for urologists, and urologists in training, regarding the basic science of imaging modalities used on a day-to-day basis in urological practice. Similarly, the intention is to provide an introduction to the

technology that is used in the practice of urological surgery and the management of urological patients in the clinical setting. This knowledge level is appropriate for certification for independent consultant practice in urology in the UK. The book is also valuable to urologists and urological trainees outside of the UK and in other surgical specialities.

Surveys key advances in commercial satellite communications and what might be the implications and/or opportunities for end-users and service providers in utilizing the latest fast-evolving innovations in this field. This book explores the evolving technical options and opportunities of satellite networks. Designed to be a self-contained reference, the book includes background technical material in an introductory chapter that will serve as a primer to satellite communications. The text discusses advances in modulation techniques, such as DBV-S2 extensions (DVS-S2X); spotbeam-based geosynchronous and medium earth orbit High Throughput Satellite (HTS) technologies and Internet applications; enhanced mobility services with aeronautical and maritime applications; Machine to Machine (M2M) satellite applications; emerging ultra HD technologies; and electric propulsion. The author surveys the latest innovations and service strategies and the resulting implications, which involves: Discussing advances in modulation

techniques and HTS spotbeam technologies. Surveying emerging high speed aeronautical mobility services and maritime and other terrestrial mobility services. Assessing M2M (machine-to-machine) applications, emerging Ultra HD video technologies and new space technology. Satellite communication is an integral part of the larger fields of commercial, television/media, government, and military communications, because of its multicast/broadcast capabilities, mobility, reliability, and global reach. High Throughput Satellites) are expected to revolutionize the field during this decade, providing very high speed, yet cost-effective, Internet access and connectivity anywhere in the world, in rural areas, in the air, and at sea. M2M connectivity, enabled by satellite communications, connects trucks on transcontinental trips, aircraft in real-time-telemetry aggregation, and mercantile ships. A comprehensive analysis of the new advances in satellite communications, Innovations in Satellite Communications Technology is a reference

for telecommunications and satellite providers and end-users, technology investors, logistic professionals, and more.

Imaging and Technology  
in Urology Muska/Lipman  
The color photographs  
and illustrations  
appearing in select  
monographs over the past  
decade represent a  
significant advance in  
surgical communication.  
Previously, black and  
white renderings were  
standard because color  
printing had not been  
perfected and its cost was  
prohibitive. We believe  
the gradual change from  
black and white etchings  
and reproductions to  
detailed color illustrations  
represents a tremendous  
twentieth century  
achievement. In our own  
urologic practices it  
became evident that the  
use of black and white  
sketches for teaching  
operative urology, while  
helpful, left too much to  
the surgeon's  
imagination. Even the  
dimension of depth,  
produced by varying the  
intensity of shading, often

was inadequate in  
demonstrating subtle  
surgical details in a fossa  
or bed. Since color  
photography recently has  
been used to demonstrate  
operative techniques, we  
climbed on the  
bandwagon and  
photographed in color  
many of the major  
operative procedures.  
However, the reflection of  
light caused by normal  
tissue fluid significantly  
reduces the clarity of  
photographs. Not  
infrequently, the crucial  
operative step is obscured  
by light reflected on a  
trickle of blood. Even  
when meticulous care is  
taken to irrigate and  
clean the surgical field,  
the tissue sheen obscures  
portions of the field. Color  
paintings by a gifted artist  
are not only unique, but  
can be extraordinary; the  
vividness with which  
subtleties can thus be  
portrayed cannot be  
matched by photography,  
black and white or color.
