The ideal handbook for Physical Therapy students going through orthopaedic clinic rotations, with step-by-step guidelines and a convenient size. Market / Audience Primary Market: 30,000 Physical Therapy students in the US Secondary: 155,000 practicing Physical Therapists About the Book Physical Therapy students spend a lot of time on clinical rotations, learning how to treat the most common orthopaedic conditions. Presently there is no pocket-sized, handy reference that will guide them through rotations and help prepare them for practice. Clinical Companion: Managing the Most Common Orthopaedic Conditions, is that book. To date, the competition has been bulky textbooks that are comprehensive but far too big to carry on rotations. This will not be a spin-off of Dutton's larger Orthopaedic text, but a practical guide with unique content that students will want. Small in size, but comprehensive in content, it will contain everything the student needs to diagnose and treat the most commonly-seen conditions. With introductory chapters to prep students for treating patients, the book will progress to four Sections covering the conditions: The Upper Quadrant, The Lower Quadrant, The Spine, and Systemic Conditions. We will also make videos available to users of the book via the Dutton Orthopaedics OLC. Key Selling Features Case studies at the end of each section to enhance the decision-making process for students Q&A will test student's ability to determine the stage of healing, decide the best course of treatment, and evaluate results throughout the patient's care. Focusing on the 50 most common orthopaedic conditions treated by Physical Therapists, this will be the first handbook-sized reference designed specifically for students on clinical rotation. Author Profile Mark Dutton, PT Allegheny Hospital West Penn Allegheny Health System (WPAHS) Adjunct Clinical Assistant Professor Duquesne University School of Health Sciences Pittsburgh, PA Mark Dutton (Bradfordwoods, PA) is an accomplished author who will ensure quality, consistency, and timeliness to this work. His career as a practicing Physical Therapist and Adjunct Assistant Professor helps keep him abreast of advances in the field and gives him an ability to translate that to the educational field. His book Orthopaedic Examination, Evaluation, and Intervention, now in its second edition, has been very successful in the PT market, as has his new title, McGraw-Hill's National Physical Therapy Exam, published in March, 2009, has also been well-received. In addition to his impressive skills and experience, he is also a can-do author who will submit manuscript on time and create questions and quality video assets for this work. Review: The following is a review of Dutton's second edition of Orthopaedic Examination, Evaluation, and Intervention (2/08): 5 STAR DOODY'S REVIEW! "Major areas in orthopedics including anatomy, kinesiology, and biomechanics of movement are covered, along with a healthy dose of pathology that impacts patient function. Clinical pearls appear in highlighted boxes throughout, and camera icons indicate where video clips should be viewed. This second edition is more comprehensive than the first. Overall, this is a valuable reference that achieves a nice balance between detailing examination and treatment. Other books tend to be limited to addressing only one of these areas, but not both. This combination makes the book unique." -- Doody's

Principles of Orthopedic Practice for Primary Care Providers Jones & Bartlett Learning

This textbook on assessment and outcome measurement is written for both occupational therapy and physiotherapy students and qualified therapists. It begins by defining what is meant by assessment, outcome, evaluation and measurement and discussing the complexity of therapy assessment and measurement, including the challenge of measuring human behaviour and the impact of factors such as task demand and context, including the environment. Methods of data collection (e.g. observation, interview, standardised testing) and sources (e.g. self-report, proxy) for collecting information about clients are then reviewed, and the main purposes of assessment (e.g.

descriptive, evaluative, predictive, discriminative) presented. The book then addresses the topics of standardisation, levels of measurement, reliability, validity and clinical utility. There is a chapter describing and applying models for categorizing levels of function to aid assessment and measurement. The concept of clinical reasoning and reflective practice is then explored. Application of principles is supported through detailed case studies and worksheets and the criteria for test critique and guidelines for choosing a particular assessment approach are discussed.
