Recent Trends in Manufacturing and Materials Towards Industry 4.0

CRC Press

Introduction to Manufacturing Management focuses on the operational and tactical issues related to the

engineering and management of manufacturing operations in factories, and the immediate links to suppliers and customers. It provides rich detail on how operations can and should be designed and organized in a factory, and on the management of technology and people. Divided into four main parts, the book covers planning and design of factories, explaining how to establish the necessary infrastructure and technology for manufacturing, before moving on to planning and control, which includes transport, processing, and storage of materials and goods inside and outside the factory. The third part explains how managers organize, lead, and maintain the factory, while the final part examines innovation activities from problem-solving to strategic improvement programs. Supported with rich pedagogy to guide the student and provide several opportunities to test their learning, this textbook will be essential reading for students of introductory production management, operations management, and manufacturing management classes.

Essentials of Manufacturing Engineering Management Springer Science & Business Media

The 18th CIRP

International Conference on Life Cycle Engineering (LCE) 2011 continues a long tradition of scientific meetings focusing on the exchange of industrial and academic knowledge and experiences in life cycle assessment, product development, sustainable manufacturing and end-of-life-management. The theme “Glocalized Solutions for Sustainability in Manufacturing ” addresses the need for engineers to develop solutions which have the potential to address global challenges by providing products, services and processes taking into account local capabilities and constraints to achieve an economically, socially and environmentally sustainable society in a global perspective. Glocalized Solutions for Sustainability in Manufacturing do not only involve products or services that are changed for a local market by simple substitution or the omitting of functions. Products and services need to be addressed that ensure a high standard of living everywhere. Resources required for manufacturing and use of such products are limited and not evenly distributed in the world. Locally available resources, local

capabilities as well as local constraints have to be drivers for product- and process innovations with respect to the entire life cycle. The 18th CIRP International Conference on Life Cycle Engineering (LCE) 2011 serves as a platform for the discussion of the resulting challenges and the collaborative development of new scientific ideas. **Advances in Manufacturing II** Elsevier Innovative Processes and Materials in Additive Manufacturing explains game-changing interdisciplinary applications of recent research breakthroughs in additive manufacturing technology.
