Internet Protocol Television (IPTV) is a  
service on the Internet where digital TV  
signal (data) is delivered to the  
participants using the Internet Protocol  
(IP). IPTV promises to provide many TV  
channels with lower price for operators &

consumers and it can be distributed more  
efficiently to the end user than traditional  
coaxial cable distribution. As it is assumed  
that broadband connection of households  
will grow at a brisk pace, IPTV will play  
more and more important role in the  
coming years in our lives. The plenty of TV  
channels requires large bandwidth for  
highly clear TV programs in IPTV service  
which is a contradictory issue to the  
limitation of user access line bandwidth  
and aggregation network bandwidth.

Multicast is a mature one-to-many packet  
data delivery technology which can be  
used for IPTV service necessary to resolve  
such contradiction. But which one and in  
which level of network, multicast will be  
best suited for this emerging technology is  
still a burning question. In this book we  
have studied all sorts of multicast protocol  
for various network level to find out a  
appropriate multicast solution for IPTV  
service.
