Entropy, and the Second Law of Thermodynamics Heat engine A is an reversible heat engine and heat engine B is an irreversible one. Both of these two engines absorb heat Q_H from a heat source, which has a temperature of T_H and reject heat to a heat sink at temperature T_L . Applying the first law to both of the engines gives, $W_{A,rev} = Q_H - Q_{A,L}$. Thermodynamics eBook: Entropy To get rid of the entropy, every heat engine must dump some waste heat into its environment. The work produced by the engine is the difference between the heat absorbed and the waste heat expelled. This seems to suggest that to maximize the efficiency of the engine, one should minimize the entropy produced during the process. thermodynamics - How is the efficiency of a heat engine ...
