There are relationships that exist between neuroanesthesia, neurosurgical procedures, individual patient pathology and the positioning of a patient for said procedure. A comprehensive examination of these relationships, their association with patient morbidity/mortality and how to approach these issues in an evidence-based manner has yet to become available. Positioning related injuries have been documented as major contributors to neurosurgical/neuroanesthesiology liability. This text examines these relationships. It provides considerations necessary to the correct positioning of a patient for a neurosurgical procedure for each individual patient and their individual pathology. In other words, this text will demonstrate how to construct the necessary surgical posture for the indicated neurosurgical procedure given the individual constraints of the patient within the environment of anesthesia and conforming to existing evidence-based practice guidelines. Sections will address physiological changes inherent in positioning in relation to anesthesia for neurosurgical procedures, assessment of patient for planned procedure, as well as considerations for managing problems associated with these relationships. Additional sections will examine the relationship between neurosurgical positioning and medical malpractice and the biomechanical science between positioning devices and neurosurgical procedures. Neurosurgery and its patient population are in a constant state of change. Providing the necessary considerations for the neurosurgical procedure planned under the anesthesia conditions planned in the position planned, often in the absence of multicase study literary support, without incurring additional morbidity is the goal of this text. This book is B&W copy of the government agency publication. This edition of The Management of Sickle Cell Disease (SCD) is organized into four parts: Diagnosis and Counseling, Health Maintenance, Treatment of Acute and Chronic Complications, and Special Topics. The original intent was to incorporate evidence-based medicine into each chapter, but there was variation among evidence-level scales, and some authors felt recommendations could be made, based on accepted practice, without formal trials in this rare disorder. The best evidence still is represented by randomized, controlled trials (RCTs), but variations exist in their design, conduct, endpoints, and analyses. It should be emphasized that selected people enter a trial, and results should apply in practice specifically to populations with the same characteristics as those in the trial. Randomization is used to reduce imbalances between groups, but unexpected factors sometimes may confound analysis or interpretation. In addition, a trial may last only a short period of time, but long-term clinical implications may exist. Another issue is treatment variation, for example, a new pneumococcal vaccine developed after the trial, which has not been tested formally in a sickle cell population. Earlier trial results may be accepted, based on the assumption that the change is small. In some cases, RCTs cannot be done satisfactorily (e.g., for ethical reasons, an insufficient number of patients, or a lack of objective measures for sickle cell "crises"). Thus the bulk of clinical

experience in SCD still remains in the moderately strong and weaker categories of evidence. Not everyone has an efficacious outcome in a clinical trial, and the frequency of adverse events, such as with long-term transfusion programs or hematopoietic transplants, might not be considered. Thus, an assessment of benefit-to-risk ratio should enter into translation of evidence levels into practice recommendations. A final issue is that there may be two alternative approaches that are competitive (e.g., transfusions and hydroxyurea). In this case the pros and cons of each course of treatment should be discussed with the patient.

This publication is aimed at students and teachers involved in programmes that train medical physicists for work in diagnostic radiology. It provides, in the form of a syllabus, a comprehensive overview of the basic medical physics knowledge required for the practice of modern diagnostic radiology. This makes it particularly useful for graduate students and residents in medical physics programmes. The material presented in the publication has been endorsed by the major international organisations and is the foundation for academic and clinical courses in both diagnostic radiology physics and in emerging areas such as imaging in radiotherapy.

The new edition of this established text has been thoroughly revised and updated. It is divided into six parts. The first two parts cover the X-ray tube and X-ray generators. Part three looks at general, multipurpose radiographic equipment. Part four considers fluoroscopic equipment, and the remaining two parts provide accounts of more specialized radiographic equipment and computer-based imaging modalities.

Ball and Moore's Essential Physics for Radiographers Cambridge University Press

Since its first edition in 1980, *Essential Physics for Radiographers* has earned an international reputation as a clear and straightforward introduction to the physics of radiography. Now in its fourth edition, this book remains a core textbook for student radiographers. The authors have retained the pragmatic approach of earlier editions and continue to target the book particularly at those students who find physics a difficult subject to grasp. The fourth edition builds on the major revisions introduced in the third edition. The content has been updated to reflect recent advances in imaging technology. The chapter on Radiation Safety has been completely rewritten in the light of the latest changes in relevant legislation, and a re-examination of the physical principles underpinning magnetic resonance imaging forms the basis of a new chapter. Worked examples and calculations again feature strongly, and the innovative and popular Maths Help File, guides readers gently through the mathematical steps and concepts involved. Thereference citations have been updated and now include Internet sources.

Based on major multi-centre research in the UK, *Dying to Care* identifies why work stress is a problem in health care generally, and in HIV health care in particular. The similarities and differences between work stress experienced in general health care settings and in HIV/AIDS are explored in a state-of-the-art review of research and experience in the field to date. The book has a practical focus, and goes on to explore ways in which the unique stresses of patient advocacy in HIV/AIDS can be addressed, identifying the best approaches for management. Highlighting the practical importance of a clear distinction between the burnout and work stress for design of strategies for burnout prevention, the emergence of the concept of burnout is described and the general historical confusion between work stress and burnout examined. This will be a key handbook for managers, physicians, nurses, social workers, health advisors and counsellors working in or alongside healthcare.

This volume features bioarchaeological research that interrogates the human skeleton in concert with material culture, ethnographic data and archival research. This approach provides examples of how these intersections of inquiry can be used to consider the larger social and political contexts in which people lived and the manner in which they died. Bioarchaeologists are in a unique position to develop rich interpretations of the lived experiences of skeletonized individuals. Using their skills in multiple contexts, bioarchaeologists are also situated to consider the ethical nature and inherent humanity of the research collections that have been used because they represent deceased for whom there are records identifying them. These collections have been the basis for generating basic information regarding the human skeletal transcript. Ironically though, these collections themselves have not been studied with the same degree of understanding and interpretation that is applied to archaeological collections.

Masters Theses in the Pure and Applied Sciences was first conceived, published, and disseminated by the Center for Information and Numerical Data Analysis and Synthesis (CINDAS) * at Purdue University in 1957, starting its coverage of theses with the academic year 1955. Beginning with Volume 13, the printing and dissemination phases of the activity were transferred to University Microfilms/Xerox of Ann Arbor, Michigan, with the thought that such an arrangement would be more beneficial to the academic and general scientific and technical community. After five years of this joint undertaking we had concluded that it was in the interest of all concerned if the printing and distribution of the volume were handled by an international publishing house to assure improved service and broader dissemination. Hence, starting with Volume 18, Masters Theses in the Pure and Applied Sciences has been disseminated on a worldwide basis by Plenum Publishing Corporation of New York, and in the same year the coverage was broadened to include Canadian universities. All

back issues can also be ordered from Plenum. We have reported in Volume 24 (thesis year 1979) a total of 10,033 theses titles from 26 Canadian and 215 United States universities. We are sure that this broader base for these titles reported will greatly enhance the value of this important annual reference work. While Volume 24 reports these submitted in 1979, on occasion, certain universities do report theses submitted in previous years but not reported at the time.

This book reflects on the contemporary use of ethnography across both social and natural sciences, focusing in particular on organizational ethnography, autoethnography, and the role of storytelling. The chapters interrogate and reframe longstanding ethnographic discussions, including those concerning reflexivity and positionality, while exploring evolving themes such as the experiential use of technologies. The open and honest accounts presented in the volume explore the perennial anxieties, doubts and uncertainties of ethnography. Rather than seek ways to mitigate these 'inconvenient' but inevitable aspects of academic research, the book instead finds significant value to these experiences. Taking the position that collections of ethnographic work are better presented as transdisciplinary bricolage rather than as discipline-specific series, each chapter in the collection begins with a reflection on the existing impact and character of ethnographic research within the author's native discipline. The book will appeal to all academic researchers with an interest in qualitative methods, as well as to advanced undergraduate and postgraduate students.

This cross-disciplinary book documents the key research challenges in the mathematical sciences and physics that could enable the economical development of novel biomedical imaging devices. It is hoped that the infusion of new insights from mathematical scientists and physicists will accelerate progress in imaging. Incorporating input from dozens of biomedical researchers who described what they perceived as key open problems of imaging that are amenable to attack by mathematical scientists and physicists, this book introduces the frontiers of biomedical imaging, especially the imaging of dynamic physiological functions, to the educated nonspecialist. Ten imaging modalities are covered, from the well-established (e.g., CAT scanning, MRI) to the more speculative (e.g., electrical and magnetic source imaging). For each modality, mathematics and physics research challenges are identified and a short list of suggested reading offered. Two additional chapters offer visions of the next generation of surgical and interventional techniques and of image processing. A final chapter provides an overview of mathematical issues that cut across the various modalities.
