 A student-friendly introduction to Latin Learning Latin can prove daunting even to the brightest students. But this innovative text draws students into the story of Rome

and lets Virgil and Livy lead the way in learning declensions and conjugations. Latin Alive and Well is a classroom-tested textbook consisting of 36 units. It is designed for both high school and university classes, in both two-semester courses and intensive one-semester courses. Clear and direct, it avoids lengthy explanations in teaching grammar, instead introducing modern students to this venerable language by focusing on exercises and translations that make fine points of grammar more readily understandable. P. L. Chambers presents essential elements of grammar in a way

that enables students to read classical authors immediately, introducing them to a passage from Virgil as early as the fifth chapter. In addition to using selected readings in Roman mythology, history, and philosophy to illustrate grammatical points, she has adopted an informal, encouraging tone, with a healthy dose of humor when appropriate. Latin Alive and Well is written so simply that students with no previous exposure to a foreign language can understand and learn the grammatical concepts. Previously available only in privately published editions, it has been used nationwide.

Advances in Automatic Control is of interest to professionals and academics working in the fields of control theory, engineering applications of control, electrical engineering, power engineering, and electronics. The themes dealt with in the papers of this volume cover a large variety of topics in automatic control, including: stabilization of distributed parameter systems, disturbance attenuation in stochastic systems, analysis and simulation of discrete event systems, fault detection, characterization of linear periodic Hamiltonian systems, stability of time delay systems, flow invariance and componentwise asymptotic stability, distributed control, parametrization of stabilizing controller, vibration control, predictive control, fuzzy control, intelligent decision and control, optimal control, computer aided control, robot and CIM control, DVD and player control. The chapters present original theoretical and/or practical results in automatic control and highlight new aspects, interpretations and developments of some current issues in the field. Advances in Automatic Control is also suitable for use as a graduate-level text in engineering.

This volume makes available for the first time the complete works of the important monastic theologian, Gilbert Crispin, friend and pupil of Sr. Anselm and abbot of Westminster from 1085, and includes a completely revised edition of his influential *Disputatio Iudei et Christiani*.

Scalar diffraction from a circular aperture is a ubiquitous problem that arises in a variety of disciplines, such as optics (lenses), acoustics (speakers), electromagnetics (dish antennas), and ultrasonics (piston transducers). The problem endures despite centuries of research because each new generation of researchers rediscovers it and adds some novel insight or new result to the existing literature. Scalar Diffraction from a Circular Aperture promises a few new results and several novel insights, particularly with regard to spatial averaging. Although the text emphasizes

ultrasonic diffraction, the results and insights developed are general and may be applied to the many practical problems involving scalar diffraction from a circular aperture. Included are novel insights on mirror-image diffraction, autoconvolution diffraction, and coherent and incoherent averaging. Examples from ultrasonic imaging, a coherent imaging modality, are used to develop a fairly general theory that connects over a century of research on scalar diffraction from a circular aperture. The material is based on a synthesis of mathematics, physical optics, linear systems theory, and scalar diffraction theory. Thus, engineers, scientists, mathematicians, and students working in optics, acoustics, antenna design, biomedical engineering, non-destructive testing, and astronomy will find *Scalar Diffraction from a Circular Aperture* interesting, provocative, and useful.

These changes provide smart technologies with excellent application opportunities in aerospace, civil and electrical engineering, transportation, manufacturing, communications, defense, and medicine. *Smart Materials and Structures* presents

an overview of current developments in the characterization and applications of materials and actuators, issues surrounding their control, and the integration of smart systems and technologies. This compendium provides a valuable synopsis of this rapidly expanding and topical research field for engineers, program managers, technologists, physicists, materials scientists, and mathematicians working to advance smart materials, research methods, their applications, and robotic technologies. *Proceedings of the 4th European and 2nd MIMR Conference, Harrogate, UK, 6-8 July 1998* European Control Association *Confusing Textbooks?
