Only recently has linguistic research recognized sign languages as legitimate human languages with properties analogous to those cataloged for French or Navajo, for example. There are many different sign languages, which can be analyzed on a variety of levels—phonetics, phonology, morphology, syntax, and semantics—in the same way as spoken languages. Yet the recognition that not all of the principles established for spoken languages hold for sign languages has made sign languages a crucial testing ground for linguistic theory. Edited by Susan Fischer and Patricia Siple, this collection is divided into four sections, reflecting the traditional core areas of phonology, morphology, syntax, and semantics. Although most of the contributions consider American Sign Language (ASL), five treat sign languages unrelated to ASL, offering valuable perspectives on sign universals. Since some of these languages or systems are only recently established, they provide a window onto the evolution and growth of sign languages.

The first International Congress on Science and Skiing was held in Austria in January 1996. The main aim of the conference was to bring together original key research in this area and provide an essential update for those in the field. The link between theory and practice was also addressed,

making the research more applicable for both researchers and coaches. This book is divided into five parts, each containing a group of papers that are related by theme or disciplinary approach. They are as follows: Biomechanics of Skiing; Fitness testing and Training in Skiing; Movement Control and Psychology in Skiing; Physiology of Skiing and Sociology of Skiing. The conclusions drawn from the conference represent an invaluable practical reference for sports scientists, coached, skiers and all those involved in this area.

This book describes the changes in the brain and in cognitive functions that occur with aging in the absence of a neurological, psychiatric, or medical disease. It discusses aging-related changes in many brain functions, including memory, language, sensory perception, motor function, creativity, attention, executive functions, emotions and mood. The neural mechanisms that may account for specific aging-related changes in cognition, perception and behavior are explored, as well as the means by which aging-related cognitive decrements can be managed and possibly ameliorated. Consequently, this book will be of value to clinicians, including neurologists, psychiatrists, geriatricians, primary care physicians, psychologists and speech-language pathologists. In addition, researchers and graduate students who want to learn about the aging brain will find this an indispensable guide.

Surgical techniques that take advantage of the vaginal route are now used quite widely. The advantages of this approach are numerous: patient comfort, aesthetic results and, above all, reduced post-operative morbidity. In addition, the time necessary for hospitalization and convalescence are reduced, and that using instruments less onerous than the

This book constitutes the refereed proceedings of the Second East European Symposium on Advances in Databases and Information systems, ADBIS '98, held in Poznan, Poland in September 1998. The 25 revised full papers presented were selected from a total of 90 submissions and six extended abstracts within a special section. "East meets West". The papers are organized in topical sections on query languages, optimization, collaborative systems, schema integration, storage and version management, object systems, knowledge discovery and the Web, and systems design.

The Texas coast remained for a long time one of the least-known stretches of the American Atlantic littoral, and Galveston Bay, the coast's most prominent feature, was not even shown by commercial mapmakers until 1799. The extensive cartographic collection of the Rosenberg Library in Galveston documents the development of cartography for this region. The Rosenberg holds maps that show Galveston Bay from 1725 on, as well as the rest of Texas, the Gulf of Mexico, the Caribbean Sea, and adjacent coasts. Its maps illustrate European exploration of the New World during the sixteenth and seventeenth centuries and the development of Texas during the eighteenth and nineteenth centuries. This detailed guide to the important cartographic collection at the Rosenberg is selective, with entries describing and relating the history of more than 550 of the most significant and useful maps in the library's holdings. Included are many original maps as well as photostats of rare or otherwise inaccessible maps. The descriptions focus on developments in Galveston and along the Texas coast but include other relevant topics as well. A generous scholarly introduction by Henry G. Taliaferro III traces the early cartography of the Texas coast, evaluating the importance of various documents and placing them in historical perspective.

Every two years, the International Association for the Study of Pain publishes a compendium of benchmark papers that summarize the current status of pain research, treatment, and management throughout the world. Presented at the 15th World Congress on Pain in Buenos Aires in October 2014, these papers represent the thinking of the world's top pain scientists and clinicians. IASP distributes this book to participants in the Refresher Courses, and it is now available to pain researchers and clinicians who were unable to attend the Congress.

Every baby is a unique individual from the moment of birth, with their own likes and dislikes, strengths and sensitivities. One baby might find bright light disturbing, another may not be troubled by light at all but might find being undressed distressing. Similarly, babies differ in what they find soothing and comforting. Only by being finely tuned to a baby's unique communications can an adult fully understand that baby and provide appropriate care. The Social Baby is based on evidence about the development of communication in infants collected in research institutes around the world. By using picture sequences from video footage, this book provides captivating illustrations of key aspects of infant experience. Together with an accessible text, these illustrations provide a window into the rich and complex social world of babies. The knowledge and understanding gained from The Social Baby will help all those concerned with the care of young infants to relate more sensitively and responsively to the babies who depend on them. It will also enrich their own experience and enhance their enjoyment.

Recent studies regarding the neuropathology of specific neurological disorders suggest that both neurodevelopmental and neurodegenerative processes may play a role. However, in contrast to the neurodegeneration seen in neurological disorders such as Parkinson's and Alzheimer's disease, the term "neuroprogression" has been used to describe the neurodevelopmental aspect of pathological brain re-wiring that takes place in the context of severe psychiatric disorders, such as schizophrenia or bipolar disorder. Within psychiatry, patients with severe psychopathology, such as those depressed patients who eventually commit suicide, have been shown to present with increased inflammatory markers in the brain. A similar increase in inflammatory markers is also found in patients with bipolar disorders and schizophrenia. Thus, oxidative stress, inflammation, and changes in growth factors are thought to be the pathways of neuroprogression. Neuroprogression in Psychiatry provides a comprehensive summary of the current developments in the emerging field of neuroprogression. With contributions by leading researchers in the field, this book examines the role of neuroprogression across a wide range of specific psychiatric disorders, with chapters included on major depressive disorder, anxiety disorder, post-traumatic stress disorder, substance abuse, schizophrenia, and bipolar disorder.

The intestines are known to harbour numerous different populations of hormone-producing endocrine cells. It is probably less well known that the stomach is also remarkably rich in endocrine cells, most of which remain unidentified in functional terms. Many meetings have been devoted to the subject of intestinal hormones, but this is the first to focus on the endocrine cells and neurohormonal peptides of the stomach. The symposium was organized at a time when work in the field was beginning to gain momentum. The book contributes to understanding of how gastric hormones control local as well as distant functions but also points out the gaps in our knowledge about these phenomena. This volume presents both answers and a

number of fascinating and challenging questions for future research in the field.

Trends in Deep Learning Methodologies: Algorithms, Applications, and Systems covers deep learning approaches such as neural networks, deep belief networks, recurrent neural networks, convolutional neural networks, deep auto-encoder, and deep generative networks, which have emerged as powerful computational models. Chapters elaborate on these models which have shown significant success in dealing with massive data for a large number of applications, given their capacity to extract complex hidden features and learn efficient representation in unsupervised settings. Chapters investigate deep learning-based algorithms in a variety of application, including biomedical and health informatics, computer vision, image processing, and more. In recent years, many powerful algorithms have been developed for matching patterns in data and making predictions about future events. The major advantage of deep learning is to process big data analytics for better analysis and self-adaptive algorithms to handle more data. Deep learning methods can deal with multiple levels of representation in which the system learns to abstract higher level representations of raw data. Earlier, it was a common requirement to have a domain expert to develop a specific model for each specific application, however, recent advancements in representation learning algorithms allow researchers across various subject domains to automatically learn the patterns and representation of the given data for the development of specific models. Provides insights into the theory, algorithms, implementation and the application of deep learning techniques Covers a wide range of applications of deep learning across smart healthcare and smart engineering Investigates the development of new models and how they can be exploited to find appropriate solutions

This book reports on an experimental bilingual education program conducted in Peru by Peruvian educators and Summer Institute of Linguistics (SIL) linguists. Sections of the book discuss: (1) the historical perspective of the program; (2) program aspects such as teacher training, goals, and curriculum; (3) what this program may contribute to the development of future programs; (4) the preparation of materials in vernacular languages; and (5) bilingual education as it relates to the development of indigenous communities. Papers include "The Role of Vernacular versus Prestige Languages in Primary Education" and "Training to Train: The Key to an Ongoing Program" by Mildred L. Larson, "The Training of Bilingual Teachers" by Olive A. Shell, and "The Challenges of Primer Making" by Patricia M. Davis. Tables include teacher-training course statistics, curriculum and textbooks for bilingual schools, and a synopsis of SIL work among the Aguarunas. Figures include sample pages from texts, primers, and readers, and a variety of letters and forms for supervisory use. Photographs of students, teachers, and other community members are provided. Appendices include the resolution authorizing bilingual education in the Peruvian jungle, laws relating to bilingual education, and sample pages of the 1977 curriculum. (JK)

The Structured Clinical Interview for DSM-5 Personality Disorders (SCID-5-PD) is a semistructured diagnostic interview for clinicians and researchers to assess the 10 DSM-5 Personality Disorders across Clusters A, B, and C as well as Other Specified Personality Disorder. Designed to build rapport, the SCID-5-PD can be used to make personality disorder diagnoses, either categorically (present or absent) or dimensionally. The SCID-5-PD includes the indispensable User's Guide for the SCID-5-PD, as well as a handy self-report screening questionnaire for patients or subjects, the Structured Clinical Interview for DSM-5® Screening Personality Questionnaire (SCID-5-SPQ). The SCID-5-PD is the updated version of the former Structured Clinical Interview for DSM-IV Axis II Personality Disorders (SCID-II). The SCID-5-PD name reflects the elimination of the multiaxial system in DSM-5. Although the DSM-IV Personality Disorder criteria are unchanged in DSM-5, the SCID-5-PD interview questions have been thoroughly reviewed and revised to optimally capture the construct embodied in the diagnostic criteria. In addition, a dimensional scoring component has been added to the SCID-5-PD. The basic structure of the SCID-5-PD is similar to the other SCID-5 interviews (such as the Research Version, SCID-5-RV; and the Clinician Version, SCID-5-CV) that cover non--personality DSM-5 disorders. Features include the following: * Questions assessing the DSM-5 criteria for each of the 10 personality disorders: Avoidant Personality Disorder, Dependent Personality Disorder, Obsessive-Compulsive Personality Disorder, Paranoid Personality Disorder, Schizotypal Personality Disorder, Schizoid Personality Disorder, Histrionic Personality Disorder, Narcissistic Personality Disorder, and Antisocial Personality Disorder.* A User's Guide for the SCID-5-PD containing essential guidance for use of the SCID-5-PD, including an appendix of a completed SCID-5-PD and SCID-5-SPQ for a sample patient.* An optional SCID-5-SPQ that serves as a brief, 20-minute self-report screening tool to reduce the time of the SCID-5-PD clinical interview. The SCID-5-SPQ requires an eighth grade or higher reading level (as determined by the Flesch-Kincaid formula). Its 106 questions correspond directly to each first question in the full SCID-5-PD. The SCID-5-PD can be used in various types of research studies, just as the SCID-II. It has been used to investigate patterns of Personality Disorders co-occurring with other mental disorders or medical conditions; select a group of study subjects with a particular Personality Disorder; investigate the underlying structure of personality pathology; and compare with other assessment methods for Personality Disorders. The SCID-5-PD will serve as a valuable resource to help clinicians and researchers more accurately diagnose Personality Disorders.
