Clearly, the SPSS output for this procedure is quite lengthy, and it is beyond the scope of this page to explain all of it. What statistical analysis should I use? Statistical ... The two main types of statistical analysis and methodologies are descriptive and inferential. However, there are other types that also deal with many aspects of data including data collection, prediction, and planning. 7 Types of Statistical Analysis: Definition and Explanation Statistical tests are used in hypothesis testing. They can be used to: determine whether a predictor variable has a statistically significant relationship with an outcome variable. estimate the difference between two or more groups. Statistical tests assume a null hypothesis of no relationship or no difference between groups. Then they determine whether the observed data fall outside of the range of values predicted by the null hypothesis. Choosing the Right Statistical Test | Types and Examples There are 3 steps to take when using the chi squared test. Step 1. State the null hypothesis. There is no significant association between ____ and ____ Step 2. Calculate the chi squared statistic $\chi^2 = \sum (O-E)^2 / E$ $\chi^2 =$ chi squared statistic $O =$ Observed values $E =$ Expected values. Step 3. Test the significance of the result Statistical tests - FSC Geography Fieldwork The average gives you information about the size of the effect of whatever you are testing, in other words, whether it is large or small.
