This book provides essential knowledge for creating treatment plans for adult dental patients. Treatment planning strategies are presented to help with balancing the ideal with the practical, with emphasis placed on the central role of the patient — whose needs should drive the treatment planning process. The focus is on planning of treatment, not on the comprehensive details of every treatment modality in dentistry. CD-ROM bound into book presents five cases of varying difficulty with interactive exercises that allow users to plan treatment. What's the Evidence? boxes link clinical decision-making and treatment planning strategies to current research. In Clinical Practice boxes highlight specific clinical situations faced by the general dentist. Review Questions and Suggested Projects, located at the end of each chapter, summarize and reinforce important concepts presented in the book. Key Terms and Glossary highlights the terms that are most important to the reader. Suggested Readings lists included at the end of most chapters provide

supplemental resources. Chapter on Treatment Planning for Smokers and Patients with Oral Cancer addresses the dentist's role in managing patients with oral cancer, recognizing oral cancer and differential diagnosis of oral lesions, planning treatment for patients undergoing cancer therapy, and smoking cessation strategies. Chapter on Treatment Planning for the Special Care/Special Needs Patient examines the role of the general dentist in the management of patients with a variety of conditions including physical handicaps, mental handicaps, head trauma, hemophilia, and patients' needs before, during, or after major surgery. Chapter on Treatment Planning for the Alcohol and Substance Abuser discusses the challenges of treating this patient population, as well as how to recognize the problem, delivery of care, scope of treatment, and behavioral/compliance issues. Expanded content on Ethical and Legal Issues in Treatment Planning reflects new accreditation guidelines. Dental Team Focus boxes highlight the relevance of chapter content to the dental team. Ethics Topics boxes emphasize the ethical topics found within each chapter. International Tooth Numbering is listed alongside the U.S. tooth numbers in examples and illustrations.

Wiley-Blackwell's "Clinical Cases" series is designed to recognize the centrality of clinical cases to the profession by providing actual cases with an academic backbone. Clinical Cases in Restorative and Reconstructive Dentistry describes the principles and demonstrates their practical, every-day application through a range of representative cases building from the simple to the complex and from the common to the rare. This unique approach supports the new trend in case-based and problem-based learning, thoroughly covering topics ranging from infant oral health to complex pulp therapy. Highly illustrated in full color, Clinical Cases in Restorative and Reconstructive Dentistry's format fosters independent learning and prepares the reader for case-based examinations. The book presents actual clinical cases, accompanied by academic commentary, that question and educate the reader about essential topics in restorative and reconstructive dentistry. The book begins by laying the groundwork of the fundamental principles that apply to all cases and outlining the ten decisions to be made with all cases. The main sections of the book cover the cases themselves, examining them both by type of restoration / solution, and by type of problem. This unique approach enables the reader to build their skills, aiding the ability to think critically and independently. Clinical Cases in Restorative and Reconstructive Dentistry's case-

based format is particularly useful for pre-doctoral dental students, post-graduate residents and practitioners, both as a textbook from which to learn about the challenging and absorbing nature of restorative and reconstructive dentistry, and also as a reference tool to help with treatment planning when perplexing cases arise in the dental office.

This book reviews the evidence relating to the mechanisms, clinical efficacy, safety/toxicity, and clinical application of tooth whitening techniques and materials. All clinical techniques are profusely illustrated step by step. The book is divided into four parts, the first of which explains how tooth whitening with peroxides works and examines the overall safety of peroxides and potential complications. The findings of clinical trials with peroxide-based materials for clinical practice are then examined, with discussion of a wide range of issues in at-home whitening and in-office whitening. The third part focuses on the techniques of enamel microabrasion and resin infiltration, which entail removal of a microscopic layer of enamel and may be used to improve tooth color either alone or in combination with peroxides. The concluding part includes a variety of informative clinical cases using combined bleaching and restorative techniques for discolored teeth. Tooth Whitening — An Evidence-Based Perspective will be of interest for dentists, dental hygienists, dental assistants, and others with an interest in the subject

Digital equipment in all dental practices is commonplace. From digital imaging through electronic recordkeeping, general dentists and specialists are seeing more accurate diagnoses, faster treatment times, and lower costs for equipment. Here in one volume is a comprehensive look at the digital technology available, describing indications, contraindications, advantages, disadvantages, limitations, and applications in the various dental fields. Included are digital imaging, digital impressions, digital operative dentistry, digital prosthodontics, digital implant fabrication and placement, and digital applications in endodontics, orthodontics, and oral surgery. The book is ideal for dental students seeking a reference for digital dental technology and for seasoned practitioners and specialists interested in incorporating digital technology in their daily practice.

Do you know what impact a patient's condition or medication could have on dental treatment? Always be certain with this chairside resource designed to alert you to the dental significance or implications of medical conditions, drugs, emergencies, and more. Clinical algorithms expedite decision making, and a CD-ROM lets you search the text and print hundreds of patient education handouts provided in both English and Spanish. Information is specifically tailored to dentistry by pointing out the dental significance or implications of each subject, including how conditions, medications, emergencies, and more can affect dental treatment. Consistent concise organization makes it easy to locate key information. Covers over 300 topics from simple pharmacologic information to rare medical diseases. Includes ICD-9 CM and CPT diagnostic/treatment codes for

insurance records and categorization with outside agencies to help professionals and staff understand how particular conditions fit into insurance continuums and facilitate better communication with outside groups. Discusses when a treatment should/can be referred to other health care providers. Appendices present facts and tips related to a variety of more common conditions in one location for easier treatment planning Clinical algorithms chart possible paths for managing common conditions to expedite decision making. Reference listings suggest reliable sources for more in-depth reading on each topic. CD-ROM contains 950 patient education handouts in English and Spanish to enhance communication between practitioners and their patients.

The Dominican healthcare system faces many challenges, and dental education is not an exception. The lack of competencies established for dentistry is one of the most critical challenges that dentistry faces. There is no way to guarantee that all dentists receive the same quality education with no standards and lack of competencies. Previous research has revealed that the competencies achieved by dental students determine the way such students develop their professional practice in the future as dental graduates (Alcota, De Gauna, & González, 2016). However, there is a lack of shared language observed in dental education around the world. Not all countries have determined a set of competencies to be taught within university dental schools. Therefore, this study examines the perceptions of multiple stakeholder groups regarding the current curriculum used in dental schools within the Dominican Republic (DR), and how well it helps students acquire critical competencies and clinical skills. The research design was a quantitative approach using online and hard copy surveys and a convenience sample method. My respondents included 400 participants: 153 undergraduate dental students attending nine DR's universities, 108 dental graduates, 153 faculty members, and 42 industry professionals. The 2008 "American Dental Education Association (ADEA) Competencies" were the primary guide for developing the surveys. ADEA Competencies were translated into Spanish and were used as part of the investigations. Other items from other countries' dental competencies and clinical skills were reviewed. Cronbach's alpha revealed internal validity: from 0.989 to 0.993. The data were analyzed using descriptive statistics, summary scores, a univariate ANOVA, and Multiple Linear Regression (MLR). Models with different sets of predictors were evaluated using model fit statistics. This study revealed a general agreement between the four stakeholder groups regarding acquiring competencies and clinical skills by DR dental students. Dental student's overall average preparedness to practice dentistry effectively was fairly good (M=4.96, SD=1.07; on a 6.0 scale). Despite these findings, significant differences were found regarding the competencies, clinical skills, program components, and university participants' origin. There were several strong predictors of competencies and clinical skills acquisition. Regarding the students, the competencies predictors were: the clinical practices of Operative Dentistry, the predictors for Clinical Skills acquisition were related to the university, the clinical practices in Oral Surgery, and the preclinical courses of Prosthodontics. Regarding the practicing dentists, the predictors for competencies were: the preclinical courses of Dental Anatomy, Pediatric Dentistry, Endodontics, and the clinical practices of Oral Surgery, that were also predictors for clinical skills acquisition. Regarding the faculty, the predictors for competencies and clinical skills were: the clinical practices of Prosthodontics and Periodontics. Overall, the findings revealed that the university attended was a predictor for competency achievement. I suggest creating both a National Advisory Board for Dental Education, and a Board of Advisors at every dental school to provide feedback to improve preclinical and clinical courses. Several topics could be considered for additional research. It could be interesting to study the differences in competency achievement by the university attended, and faculty perspectives for improving student's competency achievement and DR dental education.
