 This IBM® Redbooks® publication describes IBM DB2® SQL compatibility features. The latest version of DB2 includes extensive native support for the PL/SQL procedural language, new data types, scalar functions, improved concurrency, built-in packages, OCI, SQLPlus, and more. These features can help with developing applications that run on both DB2 and Oracle and can help

simplify the process of moving from Oracle to DB2. In addition, IBM now provides tools to simplify the enablement process, such as the highly scalable IBM Data Movement Tool for moving schema and data into DB2, and an Editor and Profiler for PL/SQL provided by the IBM Data Studio tool suite. This Oracle to DB2 migration guide describes new technology, preferred practices for moving to DB2, and common scenarios that can help you as you move from Oracle to DB2. This book is intended for IT architects and developers who are converting from Oracle to DB2. DB2 compatibility with Oracle is provided through native support. The new capabilities in DB2 that provide compatibility are implemented at the lowest and most intimate levels of the database kernel, as though they were originally engineered for DB2. means that the DB2 implementation is done without the aid of an emulation layer. This intimacy leads to the scalable implementation that DB2 offers, providing identical performance between DB2 compatibility features and DB2 other language elements. For example, DB2 runs SQL PL at the same performance as PL/SQL implementations of the same function.

[DB2 SQL Procedural Language for Linux, UNIX, and Windows](#) IBM.Com/Redbooks Inescapable Data: Harnessing the Power of Convergence Preface Overview Greetings. Technology and technological advances are always interesting. The intention of this book is not just to showcase new technologies and their specific values, but rather to examine the special values that emerge when some key technologies are intermixed, and primarily intermixed with many different (usually real-time) sources of data. Data is all around us and it is growing at a furious pace—from cellular-controlled ovens to video-controlled manufacturing to embedded chips in our bodies—and we cannot help but wonder whether the new pervasive wireless technologies will allow for unforeseen power to come from all this gathered data. The Inescapable Data environment specifically looks for new streams of data to be combined and analyzed against other streams or historical data in an effort to drive higher personal or business value. For example, although it might be interesting to have your child's school record available electronically, it is perhaps more interesting to be able to correlate various achievements and progress against a wide population—and even further interesting to correlate that data against a detailed analysis of his or her medical history. In a more business-

oriented example, technology might enable us to track inventory levels better and in real time. However, inventory-level information might be the wrong question to ask? New levels of efficiency appear in the Inescapable Data world because business systems are tied so closely together, across company boundaries, that inventory level no longer becomes the question and is replaced by "are any manufacturing dependencies suggesting date-skew anywhere in our outside supply chain for product X?" In the Inescapable Data world, we allow our business systems to join together throughout a product's value chain—and even perhaps to competitors—for the sake of efficiency and flexibility. Similarly, our personal lives demand continuous connectivity to all the activities that comprise our days. Whether it is communication with customers in different time zones or e-sending to the team a better map to the soccer field, we discover time efficiencies that in turn give us more flexibility. The tools of our business lives have become the exact same tools used in our personal lives, allowing for a convenient blending of activities. Most of this, we believe, is for the good. Some of it brings new worries and exposures. But as notable Harvard sociologist Nicholas Christakis says, "There is a way in which technology is inexorable, so I doubt there is a way to stop any of this." Intended Audience This book is designed to inform the modern business manager (as well as the techno-curious) about important developments and usage of data-everywhere devices and networks. Our mission is to help a wide range of decision makers learn to spot the emergence of Inescapable Data and capitalize on it appropriately. A wider audience for this book includes individuals from engineering through marketing in high-technology companies who want to be informed of trends outside of their more narrow industry segments. That said, the book is broad enough in scope and written with only a modest assumption of technical understanding so that most adults can understand, appreciate, and possibly value the information. The Interviews as a Foundation Although we consider ourselves knowledgeable regarding computing, networking, and data storage, we wanted to get out on the street and talk firsthand with key people from many different disciplines. We reached out to nearly 50 different executives and experts for one-on-one interviews (the vast majority conducted in person). We wanted to learn what these people are seeing, and then showcase their knowledge in a broader light,

supplemented by heavy direct research. The inside front cover of this book identifies the various people whom we interviewed at length to gain a richer understanding of the technology and trends occurring in a variety of industries, thus supplementing our general research. Their thoughts and views assisted in formulating the notions presented throughout this book. © Copyright Pearson Education. All rights reserved.

Lessons From The Trenches Pearson Education

There has been a considerable focus on performance improvements as one of the main themes in recent IBM DB2® releases, and DB2 12 for IBM z/OS® is certainly no exception. With the high-value data retained on DB2 for z/OS and the z Systems platform, customers are increasingly attempting to extract value from that data for competitive advantage. Although customers have historically moved data off platform to gain insight, the landscape has changed significantly and allowed z Systems to again converge operational systems with analytics for real-time insight. Business-critical analytics is now requiring the same levels of service as expected for operational systems, and real-time or near real-time currency of data is expected. Hence the resurgence of z Systems. As a precursor to this shift, IDAA brought the data warehouse back to DB2 for z/OS and, with its tight integration with DB2, significantly reduces data latency as compared to the ETL processing that is involved with moving data to a stand-alone data warehouse environment. That change has opened up new opportunities for operational systems to extend the breadth of analytics processing without affecting the mission-critical system and integrating near real-time analytics within that system, all while maintaining the same z Systems qualities of service. Apache Spark on z/OS and Linux for System z also allow analytics in-place, in real-time or near real-time. Enabling Spark natively on z Systems reduces the security risk of multiple copies of the Enterprise data, while providing an application developer-friendly platform for faster insight in a simplified and more secure analytics framework. How is all of this relevant to DB2 for z/OS? Given that z Systems is proving again to be the core Enterprise Hybrid Transactional/Analytical Processing (HTAP) system, it is critical that DB2 for z/OS can handle its traditional transactional applications and address the requirements for analytics processing that might not be candidates for these rapidly evolving targeted analytics systems. And not only are there opportunities for DB2

for z/OS to play an increasing role in analytics, the complexity of the transactional systems is increasing. Analytics is being integrated within the scope of those transactions. DB2 12 for z/OS has targeted performance to increase the success of new application deployments and integration of analytics to ensure that we keep pace with the rapid evolution of IDAA and Spark as equal partners in HTAP systems. This paper describes the enhancements delivered specifically by the query processing engine of DB2. This engine is generally called the optimizer or the Relational Data Services (RDS) components, which encompasses the query transformation, access path selection, run time, and parallelism. DB2 12 for z/OS also delivers improvements targeted at OLTP applications, which are the realm of the Data Manager, Index Manager, and Buffer Manager components (to name a few), and are not identified here. Although the performance measurement focus is based on reducing CPU, improvement in elapsed time is likely to be similarly achieved as CPU is reduced and performance constraints alleviated. However, elapsed time improvements can be achieved with parallelism, and DB2 12 does increase the percentage offload for parallel child tasks, which can further reduce chargeable CPU for analytics workloads.
