The Epidemiology of human pediculosis in Ethiopia BoD - Books on Demand

A consummate classic with a fresh approach to pediatric dermatology. Children's skin is different. Maturation affects the epidermal

barrier, the cutaneous microbiome, adnexal structures, vasculature, and transcutaneous absorption of drugs. The immature skin is more susceptible to pathogens and environmental disruption. Many genetic disorders are either present at birth or manifest early in childhood. Skin diseases thus present differently in children than in adults.

Pediatric dermatology has seen significant advances over the last decade, particularly in the field of molecular genetics research, which has furthered our understanding of the pathogenesis of many skin diseases and the development of new approaches to treatment. This fourth edition of the Harper classic provides state-of-the-art

information on all aspects of skin disease in children. It covers the diagnosis and treatment of all conditions - both common and rare - with a consistently evidence-based approach. Existing content has been refreshed and fully updated to reflect emerging thinking and to incorporate the latest in research and clinical data - especially at the genetic level. This new fourth edition includes: Greater focus on the genetics behind skin disease, including new

genes/genodermatoses, progress in genetic analysis, and stem cell transplants Increased coverage of lasers and other technologies used to treat skin disease More summary tables, learning points, tables of differential diagnosis, and clinical algorithms for diagnosis and management Additional online features, including patient information links and multiple choice questions Harper's Textbook of Pediatric Dermatology delivers crucial clinical insights

and up-to-date research information that spans the breadth of the field. As the most comprehensive reference book on this subject available, this revised fourth edition will support and guide the daily practice of both dermatologists and pediatricians across the world.

Since the beginning of civilization, humans and animals have developed very strong associations to their mutual benefits.

Livestock, particularly bovines, are important contributors to total food production in the world. The social expectations in Science and Technology are increasing because of rapid advances.

Prevention and control of infectious diseases in bovines have been among the top-most public health objective in the last decade. In the present book, experts from different continents present important aspects of bovine science such as louse infestations of ruminants, cytogenetics

of bovines, factors of competitiveness for bovines, feed manipulation, enhancement of conjugated linoleic acid and its bioavailability, emergence of antimicrobial resistance, and also meat quality. The aim of this book to provide an understanding of the present scenario, advances and challenges in bovine science.

There have always been homeless people in the United States, but their plight has only recently stirred widespread public reaction and concern. Part of this new recognition stems from the problem's prevalence: the number of homeless individuals,

while hard to pin down exactly, is rising. In light of this, Congress asked the Institute of Medicine to find out whether existing health care programs were ignoring the homeless or delivering care to them inefficiently. This book is the report prepared by a committee of experts who examined these problems through visits to city slums and impoverished rural areas, and through an analysis of papers written by leading scholars in the field.

Pediculosis, also known as head lice, is the most prevalent communicable disease among school-age children. Despite the use of medicated shampoos and treatments, the prevalence of head lice continues to increase. Many parents have the misconception that medicate shampoos alone

will eliminate head lice. As a result, many children experience recurrences due to ineffective treatment. Many research studies have been conducted regarding the effectiveness of medicated shampoos and treatments; however, no research is available that addresses the effect of parent education on appropriate head lice treatment and decreased recurrences of head lice. The purpose of this outcome study, which used a retrospective design, was to determine

whether parent education on the appropriate treatment for head lice decreased recurrences in school-aged children. The expectation was that there would be a decrease in the number of head lice recurrences when parents were educated about appropriate treatment at the time of the first infestation. A small, rural school district served as the sample setting. All school-age children infested with pediculosis ho were sent home from school during the 1998-1999 (School Year

One), 1999-2000 (School Year Two) and 2000-2002+1 (School Year Three) school years were identified from the school nurse's pediculosis case log and daily health office records. During school year one, parents were notified to pick up their child if head lice infestation was identified. Educational materials were not provided and appropriate head lice treatment was not discussed. During school year two and three, parents were called to pick up the child if

pediculosis was identified. In addition, the school nurse met with the parent to discuss head lice treatment, identified the nits and or live lice in the child's hair for the parent, and answered any questions. Simple frequencies and percentages were used to compare the number of head lice infestations between school years and to evaluate the effectiveness of parent education in decreasing recurrence.

This book is devoted exclusively to differential

diagnosis in pediatric dermatology. It covers the full range of relevant conditions: inherited skin disorders; nevi; viral, bacterial, fungal, and parasitic infections; acne; allergic diseases; autoimmune skin disorders; connective tissue diseases; tumors; and miscellaneous conditions. Each comparison addresses the differential diagnosis between two (or occasionally three or four) dermatological conditions, containing between two and six images and a

short text emphasizing the clinical differences between the diseases in question. At the end of each chapter, a summary highlights one or two characteristics essential for the differential diagnosis. The author is an expert who, since 1982, has been responsible for a column devoted to the differential diagnosis of pediatric dermatology in the European Journal of Pediatric Dermatology. The volume will represent an ideal tool for pediatric dermatologists,

pediatricians, and GPs, and will help them in the diagnostic process.

Global warming and globalization are the buzzwords of our time. They have nearly reached a religious status and those who deny their existence are considered modern heretics. Nevertheless, the earth has become an overcrowded village, traversable within a single day. Thus it is hardly surprising that besides persons and goods also agents of disease are

easily transported daily from one end of the world to the other, threatening the health and lives of billions of humans and their animals. Agents of diseases (prions, viruses, bacteria, fungi and parasites) are not only transmitted by body contact or direct exchange of bodily fluids, but also by means of vectors which belong to the groups of licking or blood-sucking arthropods (mites, ticks, insects) that live close to humans and their houses. Without a doubt the recently

accelerating globalization supports the import of agents of disease into countries where they never had been or where they had long since been eradicated, leading to a false sense of living on a “safe island.” These newly imported or reintroduced diseases – called “emerging diseases” – may lead to severe outbreaks in cases where the countries are not

prepared to combat them, or in cases where viruses are introduced that cannot be controlled by medications or vaccines. Arthropods are well known vectors for the spread of diseases. Thus their invasion from foreign countries and their spreading close to human dwellings must be blocked everywhere (in donor and receptor countries) using safe and effective

measures. This book presents reviews on examples of such arthropod-borne emerging diseases that lurk on the fringes of our crowded megacities. The following topics show that there is an ongoing invasion of potential vectors and that control measures must be used now in order to avoid disastrous outbreaks of mass diseases.
