Accounting Simplified
is a manager's guide to

accounting for making effective corporate decisions. The accountant's lingo consists of difficult language and financial jargons existing in the mainstream literature of finance. Understanding P&Ls, costing, balance sheet, income and cash flows statements for a fresh graduate or a rookie manager from a non-financial background can be challenging, leading to total disinterest in the area or dependency on finance managers or even erroneous decision-making. This book will help managers in understanding the analysis of balance sheet, statement of profit and loss and cash flows statement. It includes case studies of financial statements

of major listed companies and checklists to understand the financial health and performance of the organization. The book will help young managers, accounting executives and academicians use accounting insights for improving business performance.

The financial statements of a company record important financial data on every aspect of a business's activities. As such they can be evaluated on the basis of past, current, and projected performance. In general, financial statements are centered around generally accepted accounting principles (GAAP) in the U.S. These principles require a company to create and maintain three main financial statements: the balance sheet, the income statement, and the cash flow statement. Public companies have

stricter standards for financial statement reporting. Public companies must follow GAAP standards which requires accrual accounting. Private companies have greater flexibility in their financial statement preparation and also have the option to use either accrual or cash accounting. Several techniques are commonly used as part of financial statement analysis. Three of the most important techniques include horizontal analysis, vertical analysis, and ratio analysis. Horizontal analysis compares data horizontally, by analyzing values of line items across two or more years. Vertical analysis looks at the vertical affects line

items have on other parts of the business and also the business's proportions. Ratio analysis uses important ratio metrics to calculate statistical relationships.
