In examining brain damage biomechanics, it is not the blow or the whiplash, but what happens inside the skull, which causes the injury. The two most significant causes of brain injury are the "contact" of the head with a blunt object and the "inertia" as a result of a rapid acceleration or deceleration of the brain. Brain Damage Biomechanics from Traumatic Forces Biomechanics is defined as mechanics applied to biology, and mechanics itself is the response of bodies to forces or displacements. For example, when we displace (or try to displace) a body, it may move or it may stretch. Biomechanics - an overview | ScienceDirect Topics Brain tissue mechanics Nonlinear dynamic behavior Visco-hyperelastic Bulk response High rate abstract The dynamic behavior of porcine brain tissue, obtained from a series of in vitro observations and experiments, is analyzed and described here with the aid of a large strain, nonlinear, viscoelastic constitutive model. Biomechanics of brain tissue The biomechanics of TBI (including concussions) is defined broadly as the interrelationships among the forces experienced during impact, head and neck movements, stiffness of the tissue that composes the head/neck complex, deformation of structures at the macroscopic and microscopic level, and the biological responses to the various loading conditions imposed on the head. Biomechanics of Soft Tissue Traumatic brain injury (TBI) is a significant public health problem, on pace to become the third leading cause of death worldwide by 2020. Moreover, emerging evidence linking repeated mild traumatic brain injury to long-term neurodegenerative disorders points out that TBI can be both an acute disorder and a chronic disease.
