Local functional systems that create inefficient islands of information are being replaced by expensive enterprise-wide applications that unify the functional areas; however, while we have not yet been able to completely and seamlessly integrate across functions, we find that the new islands of information are no longer functional but political, cultural, linguistic, and geographical. The global village is a reality and enterprise resource planning (ERP) implementations face new issues and challenges. *Enterprise Resource Planning for Global Economies: Managerial Issues and Challenges* provides authoritative research on the theoretical frameworks and pragmatic discussions on global implementations of information systems, particularly ERP systems. This volume of *Advances in Intelligent and Soft Computing* contains accepted papers presented at the 10th International Conference on Soft Computing Models in Industrial and Environmental Applications (SOCO 2015), held in the beautiful and historic city of Burgos (Spain), in June 2015. Soft computing represents a collection or set of computational techniques in machine learning, computer science and some engineering disciplines, which investigate, simulate and analyze very complex issues and phenomena. This Conference is mainly focused on its industrial and environmental applications. After a thorough peer-review process, the SOCO 2015 International Program Committee selected 41 papers, written by authors from 15 different countries. These papers are published in present conference proceedings, achieving an acceptance rate of 40%. The selection of papers was extremely rigorous in order to maintain the high quality of the conference and we would like to thank the members of the International Program Committees for their hard work during the review process. Enterprise Resource Planning (ERP), Supply Chain Management (SCM), Customer Relationship Management (CRM), Business Intelligence (BI) and Big Data analytics (BDA) are business related

tasks and processes, which are supported by standardized software solutions. The book explains that this requires business-oriented thinking and acting from IT specialists and data scientists. It is a good idea to let students experience this directly from the business perspective, for example as executives of a virtual company in a role-playing game. The second edition of the book has been completely revised, restructured and supplemented with actual topics such as blockchains in supply chains and the correlation between Big Data analytics, artificial intelligence and machine learning. The structure of the book is based on the gradual implementation and integration of the respective information systems from the business and management perspectives. Part I contains chapters with detailed descriptions of the topics supplemented by online tests and exercises. Part II introduces role play and the online gaming and simulation environment. Supplementary teaching material, presentations, templates, and video clips are available online in the gaming area. The gaming and business simulation [Kdibisglobal.com](http://Kdibisglobal.com), newly created for this book, now includes a beer division, a bottled water division, a soft drink division and a manufacturing division for barcode cash register scanner with their specific business processes and supply chains.

To achieve success in today's business climate you must do more than provide high quality low cost products to customers when and how they want them. Customers and suppliers require fully integrated information - throughout the supply chain or value chain. You must integrate your organization so completely that executive decisions are implemented effortlessly. Competitive pressures often cause a reduction in prices, in spite of continually rising costs. A decrease in prices paired with increased costs quickly eliminates any profitability and threatens your company's ability to survive. This book shows you how you can reduce costs through the elimination of waste caused by poor communication and coordination throughout a company as well as between the company, its suppliers, and its customers. The author explains Enterprise Resource Planning (ERP) in non-technical terms, describing how an ERP system can fully integrate all functions in your manufacturing organization. He demonstrates the system's capability to increase efficiency and profitability - and to delight the customer - as well as its current deficiencies. In addition to his thorough coverage of ERP, the author introduces Total Enterprise Integration (TEI), the process of integrating all the information required to fully support a manufacturing company. TEI represents a logical extension of complete information integration throughout a manufacturing enterprise and into the supply chain. This new concept shows you how the intelligent use of work flow allows

responsibility to go to the most appropriate front-line decision makers while maintaining proper budgetary and operational controls. The power of TEI is in the integration of communication across the entire manufacturing company, and out through the supply chain to customers and suppliers. Enterprise Resource Planning and Beyond: Integrating Your Entire Organization focuses on what a fully integrated system can do for you. Features
