 Excerpt from Principles of Wool Combing IN preparing this book it has been my chief object to arrange facts and statistics in such a way that the figures shall not be merely lists of dimensions and speeds, but that they shall help to explain the value of each working part, in the theory and practice of wool combing.  This book constitutes the proceedings of the 49th International Conference on Current Trends in Theory and Practice of Computer Science, SOFSEM 2024, held in Cochem, Germany, in February 2024. The 33 full papers presented in this book were carefully reviewed and selected from 81 submissions. The book also

contains one invited talk in full paper length. They focus on original research and challenges in foundations of computer science including algorithms, AI-based methods, computational complexity, and formal models.

*The Oxford Handbook of the Archaeology of Death and Burial* reviews the current state of mortuary archaeology and its practice, highlighting its often contentious place in the modern socio-politics of archaeology. It contains forty-four chapters which focus on the history of the discipline and its current scientific techniques and methods. Written by leading, international scholars in the field, it derives its examples and case studies from a wide range of time periods, such as the middle palaeolithic to the twentieth century, and geographical areas which include Europe, North and South America, Africa, and Asia. Combining up-to-date knowledge of relevant archaeological research with critical assessments of the theme and an evaluation of future research trajectories, it draws attention to the social, symbolic, and theoretical aspects of interpreting mortuary archaeology. The volume is well-illustrated with maps, plans, photographs, and illustrations and is ideally suited for students and researchers.

 The first nonlinear optical effect was observed in the 19th century by John Kerr. Nonlinear optics, however, started to grow up only after the invention of the laser, when intense light sources became easily available. The seminal studies by Peter Franken and Nicolaas Bloembergen, in the 1960s, paved the way for the development of today's nonlinear photonics, the field of research that encompasses all the studies, designs, and implementations of nonlinear optical devices that can be used for the generation, communication, and processing of information. This field has attracted significant attention, partly due to the great potential of exploiting the optical nonlinearities of new or advanced materials to induce new phenomena and achieve new functions. According to Clarivate Web of Science, almost 200,000 papers were published that refer to the topic "nonlinear optic\*". Over 36,000 papers were published in the last four years (2015–2018) with the same keyword, and over 17,000 used the keyword "nonlinear photonic\*". The present Special Issue of Micromachines aims at reviewing the current state of the art and presenting perspectives of further development. Fundamental and applicative aspects are considered, with special attention paid to hot topics that may lead to technological and scientific breakthroughs.

From keys and handkerchiefs to sweets and rubber bands, the curious objects we surround ourselves with, though often seemingly mundane, have a magical quality. Their surprising power to disturb, soothe, seduce or absorb give these quirky objects histories and meanings we rarely ponder. Yet we would be lost without them. Take bags, for example. Why do most women carry handbags, while men rely on pockets? Why do so many houses have bags of bags? And why do we 'let the cat out the bag' or 'give someone the sack'? What significance do our bags hold for us? In this highly imaginative and entertaining book, Steven Connor embarks on a historical, philosophical and linguistic journey that explores our relationships with the curious things with which we have a forgotten but daily intimacy.
