The in-depth study of parasites along with their hosts is known as parasitology. The study of the relationship between the parasite and the host is also within the scope of this field. As a sub-field of biology, parasitology forms a synthesis of various other disciplines and integrates their techniques. Some of these disciplines include bioinformatics, immunology, genetics, molecular biology, etc. Medical parasitology is a subset of parasitology, which is concerned with the parasites that affect humans. It studies the diseases caused by parasites in humans and the clinical response of humans against them. The diagnosis, control, prevention and treatment of such parasitic diseases are also under the scope of this field. This book attempts to understand the multiple branches that fall under the discipline of parasitology and how such concepts have practical applications. While understanding the long-term perspectives of the topics, this book makes an effort in highlighting their impact as a modern tool for growth of the medical science. Researchers and students in this field will be assisted by this book.

This is the thoroughly revised and updated edition which aims to keep pace with the rapidly increasing information in medical sciences. The text is presented in a simple and lucid manner. It is illustrated with eight colour plates containing 52 figures, computer-drawn figures and photomicrographs. These make the book colourful and the readers can have a better understanding. The book has been divided into eight sections that include: \* General bacteriology. \* Serology/immunology. \* Parasitology. \* Systemic bacteriology. \* Mycology. \* Virology. \* Recent advances. \* Spots. Each practical exercise ends with important questions and their answers which will help the student in preparing for theory, practical and viva voce examinations.

The Textbook of Medical Parasitology is a handy guide for workers in the field and is aimed at equipping them with the specialised skills, scientific information and research tools that would enable them to understand parasitism as a biological phenomenon and its relevance to human disease. The book is also well-aligned with the clinical approach prescribed by the new undergraduate medical curriculum. Parasites are individually dealt with according to the body systems they affect, viz. intestinal, blood or tissue parasites, but are grouped according to their taxonomic statuses. Thus, the book has a clinical orientation without compromising on the conventional principles of medical parasitology. The textbook has been organised into five broad sections, which are as follows: Section I deals with the general concepts and immunology of parasitic infections. Sections II and III deal with the detailed study of protozoa and helminths respectively. Chapters on individual parasites are arranged according to the organ systems they affect (intestine, blood, tissue, etc.) to enable the study of parasites in the context of these organ systems. Each chapter contains up-to-date information about the morphology, life cycle and pathogenesis of individual parasites and the clinical features, diagnosis, management and prevention of the diseases caused by them. Simple line diagrams of parasite morphology, colourful illustrations of life cycles and standard microphotographs for laboratory diagnosis have been provided for easy assimilation of the concepts. Important information has been emphasised in tables, and separate boxes for laboratory diagnosis and treatment have been provided as tools for a quick recap. The core chapters are equipped with clinical cases and learning goals as well as descriptive and multiple-choice questions to help students prepare for their examinations. Section IV deals with disease

manifestations of infections of the major organ systems of the body (with special reference to parasites) in line with the new clinically-oriented medical curriculum. Readers can best use this section while recapitulating the subject as it provides a bird's eye view of the parasites, bacteria, fungi and viruses affecting the various organ systems of the body and the general mechanisms of the disease processes in these organs. Section V is aimed at introducing readers to the concepts of zoonotic infections and One Health; medical entomology, the knowledge of which is important in understanding vector-borne diseases; and control programmes for parasitic diseases. The three annexures at the end of the book deal with the approach to the laboratory diagnosis, laboratory procedures and materials required for testing and the drug therapy regimes for various parasitic infections. In terms of organisation, Textbook of Medical Parasitology is well-planned and succinct. The textual material is supported by clinical case studies, illustrations, photographs and descriptive and multiple-choice questions for key point revision and better preparation for the examinations. While the simplified approach to the explanation of concepts is sure to aid in the quick assimilation of knowledge and make this book enjoyable for undergraduate students of medicine, it is also a handy resource for postgraduate students of Medical Microbiology and even clinicians.

Study of parasitology, like any other branch of biological science, has in recent years been increasingly revealing and rewarding with enrichment and embellishment by basic sciences, specially with application of spectacular advances in molecular biology and biotechnology. Such a fruitful fusion of more than one discipline has now come to characterise more than ever before our approach to the subject. This volume of helminthology with contributions from a galaxy of distinguished scientists in specific areas, bears an eloquent testimony to the gratifying yield that accrues from cross fertilisation of multiple disciplines and able support from basic sciences. Metazoan parasites, helminths, living in more than one host in different stages of development, present an intricate spectrum of host-parasite relationship, which has evolved through diverse frame and flow of ecologic circumstances. The situation is further complicated, as elaborated here, by genotypic and phenotypic variations, which profoundly influence the dynamic interaction between hosts and parasites and determine consequently survival and propagation of the latter. Indeed, one of the important messages upheld in this book is that genetic endowment of parasites plays a pivotal role in their immunogenicity, pathogenicity, response to variable environmental composition, including drug response and also their transmission dynamics and epidemiology. Evolution of parasitic helminths with concomitant physiologic and morphologic alterations have been traced from free-living stage to development of host-specificity of different degrees and parasitic speciation.

Parasites and parasitic morbidity and/or disease seem to be a birth right of the tropics. This is a sequel to greater biodiversity fragmented in relation to biogeography and climatic shifts congenial to nocturnal enemies of humans, like mosquitoes. In fact in some cases parasite strategies have thwarted attempts of the scientific community to eradicate them. The best example running its course now is any kind of flu. Flu is no simple single strain strategy. At the base of parasitic diseases, man has recognized a dichotomy namely, animal diseases and diseases of man but there may be links between humans and animal (zoonoses). We owe a great deal to the British Empire in the

expansion of knowledge of tropical diseases especially of peninsular India with more or less warm climate plenty of room for growth of intermediate host like Anopheles (malaria), Culex (filaria) and Aedes (dengue). The School of Tropical Medicine and Hygiene at London is especially interested in this direction. We have at the present time many institutions in India dealing with public health problems. Schools of Tropical Medicine, Calcutta, several laboratories of preventive medicine and more recently immunology laboratories. Likewise, there has been a growth of institutions dealing with veterinary medicine and animal health. We are just beginning to understand what is known as zoonoses. That is parasites which normally infect and develop in animals can under certain circumstances infect humans and thrive with as much ease. India can now boast of being free of smallpox and plague but bad hygienic conditions are not allowing the control of malaria, dengue, filaria, typhoid, leprosy, etc. Dilution of efforts because of population explosion is the cause. A multiprolonged attack 1. Treatment, 2. Eradication of intermediate hosts (like mosquitoes) 3. Preventive measures (Prophylaxis) specific to each parasitic infection becomes a must, education is necessary. The aim of the present books is to provide a brief but reasonably comprehensive information to the medical student as well as students of medical laboratory techniques. To be a comprehensive parasitologist of some worth and meaning the present book has been designed. Equal emphasis is given to microbes and the protozoan and metazoan parasites. Two pertinent remarks can be quoted. Stoll 1947 "had said that at any army center the medical officer never heard of bancroftian filariasis (the disease) while soldiers saw it with dismay elephantiasis (the symptom) Philip 1987 had said that there is always something new under the parasitological sun.
