There is widespread interest throughout the world in improving appliance energy efficiency. Methods to reach that end include energy labeling, energy efficiency standards and market conditioning (e.g, energy efficient procurement and DSM programs). Energy efficiency standards, which started out as an action to reduce demand for energy in individual countries, has now become a subject of regional and even worldwide dimension, particularly in the context of global climate change mitigation. Mandatory energy efficiency standards are in place for some appliances in China, Canada, Mexico, the Philippines and the United States. Standards for refrigerator/freezers will take effect in

Australia and the European Union in 1999. Voluntary energy efficiency standards are in place for refrigerators in Brazil, India and Korea and for air conditioners in India, Japan and Korea. Table I showed potential global energy use reductions from codes and standards in buildings. If individual country data can be assembled, a more accurate approach to estimating potential reductions in energy use and carbon emissions would be to perform a bottom-up analysis for energy using equipment on an end-use basis in as many large developing countries as possible. The impact of standards would be assessed as more efficient appliances replaced existing stock models and new purchases that increased saturation rates were made at higher efficiencies than would otherwise be the case. This approach would show the slow but steady buildup of annual energy savings from efficiency standards or other programs to improve energy efficiency.

Factors influence householder energy efficient consumption behaviors at homes. What factors can influence householders how to use energy in efficient way at homes. It depends on different countries householders' living habits to cause their choices to use energy efficiently at homes. In general, global householders energy every day consumption or use aims include cooking, heating, and cooling or warming rooms, lighting, water-boiled use and computer playing games entertainment etc. activities at homes every day. Some activities are often essential at homes, e.g. cooking, cooling or warming temperature in rooms, lighting, water-boiled use. So, their activities must not avoid to use energy at homes often. Otherwise, some activities are not essential at homes, e.g. playing entertainment games from computers, cooling rooms in summer, listening music, watching television etc. these activities. The householder can choose either to use energy to turn on these equipment tools or not to do these non essential activities at homes often. In general, householders rely on energy to make ourselves lives comfortable, productive and enjoyable. However, global householders need to learn how we can use energy resources wisely because global every householder has responsibility to manage resources includes: reducing total energy use and using energy more efficiently in order to avoid energy shortage crise occurrence. The choices are make about how we use

energy, e.g. turning machines off when not in use of choosing to buy energy efficiency appliances will have increasing impacts on the quality of our environment and lives. Energy conservation includes any behavior that results in the use of less energy. Energy efficiency involves the use of technology that requires less energy to perform the same function. For example, a compact fluorescent light bulb that uses less energy to produce the same amount of light as an incandescent light bulb is an example of energy efficiency. So, a householder's decision to place an incandescent light bulb with compact fluorescent is an example of energy conservation. So, as individuals, every countries' householder choices and actions can result in a significant reduction in the amount of energy used in each sector of the economy. So, I bring this interesting question: What factors can influence householder to choose to do any efficient energy consumption or useful behaviors at homes? I believe every countries' householders will have their different living attitudes and their living attitudes can influence their behaviors or activities to choose hoe to use energy at home. I shall indicate some countries' householders' living attitudes to explain the factors can influence them to use energy efficiency at homes as below:  Is the low income and rising price of modern fuels both factors best to influence Nigeria householders choose to use energy efficiently? Firstly, for Nigeria householders energy consumption habit at homes example, it is richly with natural resources, modern energy resources which provide many householders with biomass ( mostly firewood) and some other householders modern energy sources, such as

kevosene, liquefied, petroleum, gas and electricity for their use. So, it is one country which can manufacture to provide energy for itself to use. It doesn't need to depend on other countries to import any kinds of energy to householders to buy to use at homes. But, it has social challenge, the poverty problem in Nigeria goes beyond low income, savings and growth rate, due to its low level of education, poor governamce, high level of unemployment factors influence.

This handbook is intended to be a source of information for the broad military community, including uniformed military personnel, family members, civilian personnel of federal agencies, veterans, and all people who contribute to the success of wounded, injured, and ill service members. When service members return from a deployment with visible or hidden impairments or challenges, it is important for the entire community to provide support to ameliorate the long-term impact of wounds, injuries, and illnesses that can manifest into permanent disabilities. The information contained in this book should help the reader understand and implement the steps necessary for helping wounded, injured, or ill service members and their families to successfully continue their military careers or to become successful as veterans within civilian communities. A multifaceted approach will be presented, and there is no one single solution that will work for all service members. However, the information contained within this handbook should provide insight into the options available and the many pathways that lead to success. 2000- John Wiley & Sons

This volume is a practical guide that helps the reader build a quick, evidence-based understanding of green-growth strategies and challenges. Its cogent analysis of real-life case studies enables policy makers and company executives identify successful strategies they can adopt, and pitfalls they can avoid, in drafting and implementing green growth policies. The contributors' empirical

assessment of these studies identifies the structural conditions required for economic growth to be compatible with environmental sustainability and how the transition to a new economic paradigm should be managed. A crucial addition to the debate now beginning in earnest around the world, this volume attempts to understand how we can nurture a new-born model of sustainable growth and help it evolve to maturity. *The quickest way to a sparkling home* John Wiley & Sons

Carbon emissions from the retail segment of the food cold chain are relatively high compared to other parts of the food cold chain. Studies have also shown that food temperature is less well controlled at the retail and consumer end of the cold chain. There is therefore considerable potential to optimize performance of refrigerated display cabinets and the refrigeration systems that are used to operate them to reduce carbon emissions and to improve food temperature control. Sustainable Retail Refrigeration draws together world experts on retail refrigeration. In a single resource, the authors cover the latest technologies and best current knowledge in the field. With increasing concerns about energy use and global warming gasses, retailers are increasingly being called to account for their actions. Sustainable Retail Refrigeration is a valuable reference to manufacturers, managers and policy makers, incorporating both a design and an operational perspective.
