Through ten editions, Fox and McDonald's Introduction to Fluid Mechanics has helped students understand the physical concepts, basic principles, and analysis methods of fluid mechanics. This market-leading textbook provides a balanced, systematic approach to mastering critical concepts with the proven Fox-McDonald solution methodology. In-depth yet accessible chapters present governing equations, clearly state assumptions, and relate mathematical results to corresponding physical behavior. Emphasis is placed on the use of control volumes to support a practical, theoretically-inclusive problem-solving approach to the subject. Each comprehensive chapter includes numerous, easy-to-follow examples that illustrate good solution technique and explain challenging points. A broad range of carefully selected topics describe how to apply the governing equations to various problems, and explain physical concepts to enable students to model real-world fluid flow situations. Cosa Nostra 2 Simon and Schuster

"What if you had a tiny pill that could change attraction into love?" Straight as an arrow, Cara, is sent on a mission to seduce and deceive the beautiful Lexi, a longtime lesbian, who just lost her father, the only family she had left. When those two women meet, their lives will change in a way neither of them could have imagined. During the course of the book, Cara has to learn the ways to please a woman. She discovers a different side of herself and has to come to terms with her newfound sexuality. But what happens when she forgets to guard her own heart in the process? Opposite of her, Lexi has to come to grips with the fact that she might have finally found love. She struggles with letting Cara in and accepting that her heart wants what it wants. As their story unfolds, the two women dance around each other and the love that is blossoming between them, but neither seems to be brave enough to face it. A beautiful story, no? It would have been, if the love pill hadn't been involved. -The love pill is a refreshing twist on the age old story about finding love. It shows that love can be found during times you never thought were possible, in places you didn't know that existed and mostly, with people you would least expect it with.

Until recently, historians tended to dismiss home economics as little more than a conspiracy to keep women in the kitchen. This landmark volume initiates collaboration among home economists, family

and consumer science professionals, and women's historians. What knits the essays together is a willingness to revisit the subject of home economics with neither indictment nor apology. The volume includes significant new work that places home economics in the twentieth century within the context of the development of women's professions. Rethinking Home Economics documents the evolution of a profession from the home economics movement launched by Ellen Richards in the early twentieth century to the modern field renamed Family and Consumer Sciences in 1994. The essays in this volume show the range of activities pursued under the rubric of home economics, from dietetics and parenting, teaching and cooperative extension work, to test kitchen and product development. Exploration of the ways in which gender, race, and class influenced women's options in colleges and universities, hospitals, business, and industry, as well as government has provided a greater understanding of the obstacles women encountered and the strategies they used to gain legitimacy as the field developed.

"When I was first starting out, I had to learn many things by trial and error, and I know I could have saved myself a lot of grief if someone had given me advice on what to do. I hope this book will help and inspire you to pursue your passion while avoiding some of the mistakes I made." It's easier than ever before to launch a startup. But in a world where barriers to entry are virtually nonexistent and everyone wants to be the next Facebook, competition is fierce. If you're just beginning and lack the money and clout to make an automatic splash, how do you differentiate yourself from all the rest? Jason Baptiste knows firsthand what it takes. After launching his first company while still in college, he cofounded his current venture, Onswipe, in his early twenties, turning it into a multimillion-dollar company in less than a year. Now, drawing on his own experience as a bootstrapping but hungry entrepreneur, as well as on examples from today's most famous companies, he guides would-be tech moguls through every stage of the process—from testing a concept to acquiring customers to determining the best pricing model—in a cheap, practical way. Among his strategies:

- Build the product you wish you had: Foursquare founder Dennis Crowley created an early version of his product because he wanted to keep in touch with former colleagues.
- It doesn't have to be sexy to make money: Dropbox took the world by storm by offering a great solution to a mundane problem—online storage.
- Be bold when promoting yourself: Online payment service WePay capitalized on dissatisfaction with industry leader PayPal by dumping six hundred pounds of ice in front of a developer conference.
- Attract fans to attract customers: Budget tracking site Mint.com created its initial user base by offering original and useful content about personal finance.

Baptiste shows you don't need an MBA, a trust fund, or even experience running your own company to become a star in the tech world. The Ultralight Startup is a comprehensive, easy-to-follow guide that will prepare any entrepreneur to take his or her idea to the next level.

These notes developed from a course on the numerical solution of conservation laws first taught at the University of Washington in the fall of 1988 and then at ETH during the following spring. The overall emphasis is on studying the mathematical tools that are essential in developing, analyzing, and successfully using numerical methods for nonlinear systems of conservation laws, particularly for problems involving shock waves. A reasonable understanding of the mathematical structure of these equations and their solutions is first required, and Part I of these notes deals with this theory. Part II deals more directly with numerical methods, again with the emphasis on general tools that are of broad use. I have stressed the underlying ideas used in various classes of methods rather

than presenting the most sophisticated methods in great detail. My aim was to provide a sufficient background that students could then approach the current research literature with the necessary tools and understanding. Without the wonders of TeX and LaTeX, these notes would never have been put together. The professional-looking results perhaps obscure the fact that these are indeed lecture notes. Some sections have been reworked several times by now, but others are still preliminary. I can only hope that the errors are not too blatant. Moreover, the breadth and depth of coverage was limited by the length of these courses, and some parts are rather sketchy.
