There has been a recent explosion of research incorporating a spatial dimension in environmental and natural resource economics, where the spatial aspects of human behaviour or the natural environment make a crucial difference in the analysis and policy response to the problem. Much of this research has been driven by the growing availability of spatially explicit social science data and the development of tools and methodological advances to use these data. Collected in this volume are 24 key articles considering the reasons for spatial variation in policies, due to either efficiency or equity considerations, and the consequences of that spatial variation for both environmental and economic outcomes.

These articles demonstrate that the failure to address spatial issues in the analysis can create two problems: (1) the analysis provides a poor basis for predicting actual behaviour that is specifically based upon spatial considerations, and (2) the analysis fails to provide a basis for designing spatially targeted policies that could lead to more efficient outcomes.

The Future of Nursing explores how nurses' roles, responsibilities, and education should change significantly to meet the increased demand for care that will be created by health care reform and to advance improvements in America's increasingly complex health system. At more than 3 million in

number, nurses make up the single largest segment of the health care work force. They also spend the greatest amount of time in delivering patient care as a profession. Nurses therefore have valuable insights and unique abilities to contribute as partners with other health care professionals in improving the quality and safety of care as envisioned in the Affordable Care Act (ACA) enacted this year. Nurses should be fully engaged with other health professionals and assume leadership roles in redesigning care in the United States. To ensure its members are well-prepared, the profession should institute residency training for nurses, increase the percentage of nurses who attain a bachelor's degree to 80 percent by 2020, and double the number who

pursue doctorates. Furthermore, regulatory and institutional obstacles -- including limits on nurses' scope of practice -- should be removed so that the health system can reap the full benefit of nurses' training, skills, and knowledge in patient care. In this book, the Institute of Medicine makes recommendations for an action-oriented blueprint for the future of nursing. Lippincott Nursing Procedures Jaypee Brothers, Medical Publishers Pvt. Practice Nurses play an important and pivotal role in healthcare providing a range of interventions and services to patients in General Practice and Primary Care settings. While most Practice Nurses work in GP surgeries and doctor led clinics, others are working as autonomous practitioners in community practices and nurse led centres. Practice

Nurses are presented with an ever increasing range of conditions and patient needs as the role is constantly changing and evolving. The extended roles and range of clinical skills which may be provided by a Practice Nurse depend on the needs of the patient and the qualifications, skills, competencies and scope of practice of each individual Practice Nurse (NMBI, 2015). Practice Nurses have a responsibility to ensure that they are suitably qualified, skilled and competent in carrying out each clinical procedure and intervention that they undertake. Developing guidelines for clinical practice is an important part of the Practice Nurse role, but the task of researching, developing and producing guidelines is time-consuming, and it can be difficult to find the information

required as and when needed. Practice Nursing: Clinical Guidelines and Procedures in Practice written by a Practice Nurse, and based on local and national guidelines, provides a comprehensive overview and a step by step guide for nurses carrying out a wide range of clinical procedures in practice. The book contains over 100 clinical guidelines and procedures with illustrations, tables, charts and diagrams. In producing these clinical guidelines, the author hopes that this book will prove useful as a resource and reference guide for other nurses in general practice and primary care settings.

Contemporary capitalistic systems have been undergoing profound transformations determined by the transition towards the so-called knowledge based economy, i.e. a competitive system based on the capabilities firms have to create, use and circulate knowledge. These transformations concern both the characteristics of productive and

innovative processes, and the resources used in these activities. This book captures these changes, where traditional R&D investments undertaken internally by firms are increasingly and strategically complemented by external sources of innovation and new knowledge. Collaborations between firms, and between firms and other organizations, as well as the mobility of human capital, are strategic processes in order to share and circulate knowledge and competencies. They are also key determinants in the creation of new knowledge and innovation, and ultimately in growth dynamics. The circulation and distribution of knowledge is now a key input in the production of knowledge. Knowledge and innovation are understood as the result of collective

and interactive processes at the system level, and less at the micro level. In other words, new knowledge production is less and less the result of individualistic behaviours of the firms and much more the effect of explicit and pro-active interactions and transactions put in place by local networks of innovators. In this perspective, economic space is much more defined by the quality of the interactions among actors rather than by their mere technological, sectoral or geographical proximity. This book brings together new conceptual and empirical contributions and blends the analysis of the technological and geographical spaces in which innovation and knowledge are produced.
