What will future sci-tech libraries be like? Who will be the key players? In this insightful volume, first published in 1992, leaders in sci-tech librarianship reflect on their years in the profession and predict how the sci-tech library will look in ten years. It takes a close look at the revolution in the communication of scientific information and how technology has transformed the process of knowledge delivery and acquisitions. It prepares libraries to react to new channels of scholarly communication that in the future may challenge the viability of the research library. Most importantly, it emphasizes how the rapid pace of change in science, communication, and computers has pushed libraries to aggressively seek to become central to the knowledge formation and transfer process - just to survive. These provocative chapters reveal how sci-tech librarians need to work with scientists and engineers to understand their changing information needs and to

participate in the planning and development of new information systems. This book examines all areas of the scientific process that will be affected by change: the way research is conducted, communicated, transferred, stored, and delivered. The changes discussed in this book encompass researchers, librarians, information managers, publishers, and users. Some of the important topics discussed include an in-depth analysis of the information needs of science and engineering and how to best develop the electronic means to meet them; leadership challenges in the future electronic, computer, or virtual library; concern over the quality of information services for scientists delivered by non-scientist librarians; a ten-year prediction for sci-tech librarians and sci-tech publishers; the science library building of the future; the impact of increasingly interdisciplinary scientific research; and the effect of federal policy on sci-tech libraries.

This book captures the messages from a workshop that brought together research managers from government, industry, and

academia to review and discuss the mechanisms that have been proposed or used to assess the value of chemical research. The workshop focused on the assessment procedures that have been or will be established within the various organizations that carry out or fund research activities, with particular attention to the Government Performance and Results Act (GPRA). The book presents approaches and ideas from leaders in each area that were intended to identify new and useful ways of assessing the value and potential impact of research activities.

Oswaal CBSE MCQs Chapterwise For Term I & II, Class 12, Chemistry (For 2021-22 Exam) 51 Simple Projects in Chemistry BANNED: The Golden Book of Chemistry Experiments was a children's chemistry book written in the 1960s by Robert Brent and illustrated by Harry Lazarus, showing how to set up your own home laboratory and conduct over 200 experiments. The book is controversial, as many of the experiments contained in the book are now considered too dangerous for the general public. There are apparently only 126 copies of this book in libraries worldwide. Despite this, its known as one of the best DIY chemistry books every published. The book was a source of inspiration to David Hahn, nicknamed "the Radioactive Boy Scout" by the media, who tried to collect a sample of every chemical element and also built a model nuclear reactor (nuclear reactions however are not covered in this book), which led to the involvement of the authorities. On the other hand, it has also been the inspiration for many children who went on to get advanced degrees and productive chemical careers in industry or academia.
